<aula 12>

Turma de FrontEnd – IF UFRGS

● Media Query

Para adaptar nossos sites à diferentes tamanhos de telas vamos utilizar o conceito de Media Query.

Media Query nada mais é do que criar um CSS para cada tamanho de tela, onde cada um recebe uma configuração com base no tamanho do dispositivo.

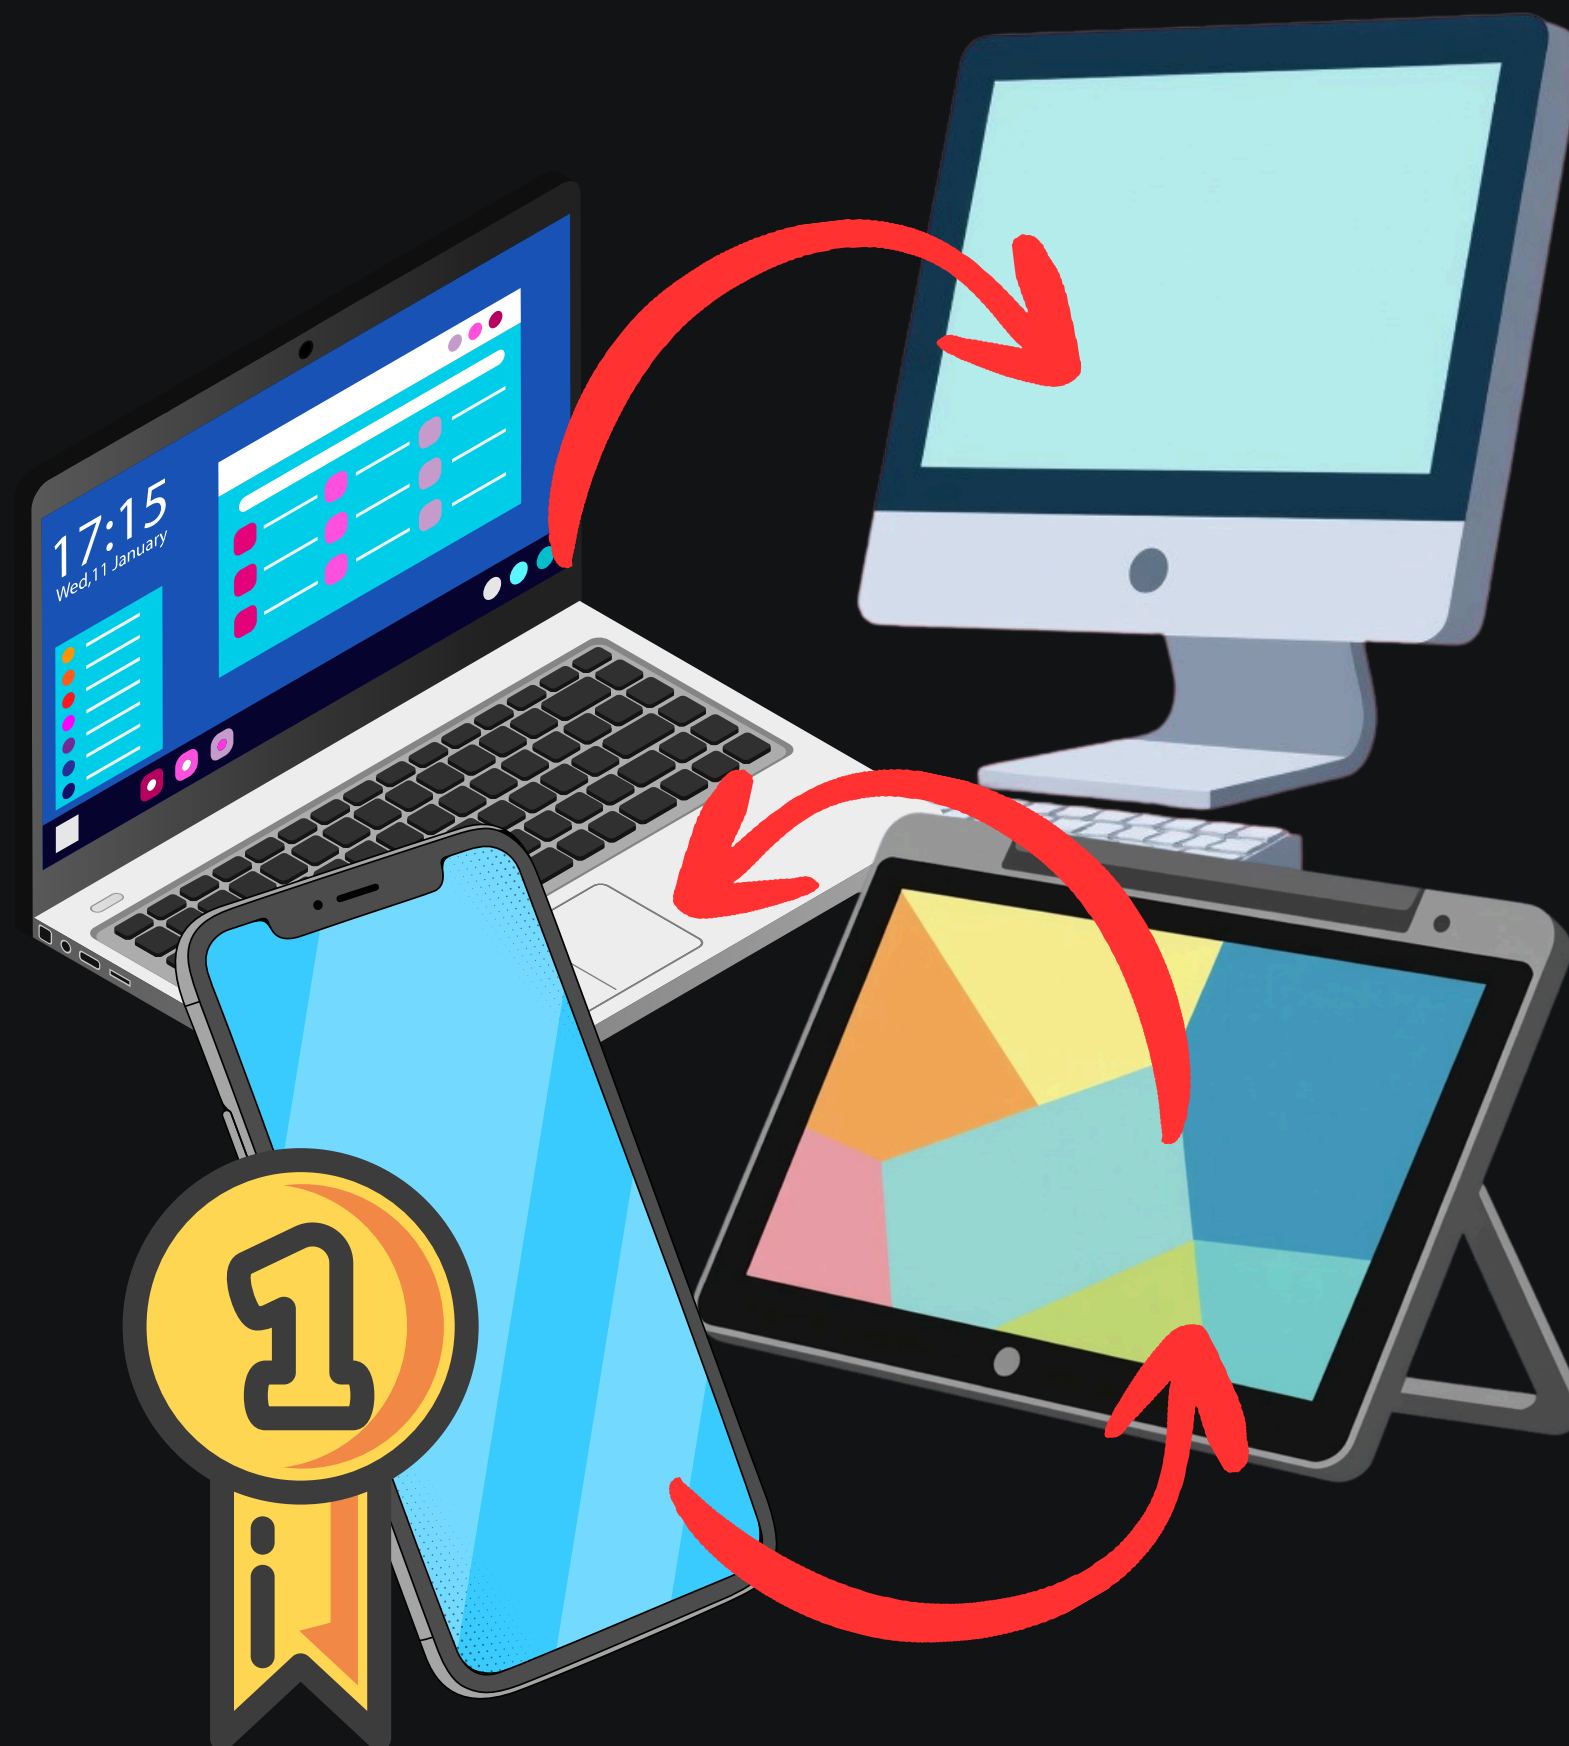

● Mobile First

Outro conceito muito importante que usamos ao trabalhar com media query é o mobile first. Isto é, como o nome sugere, criar a parte mobile primeiro.

Ao invés de criar um site grande e complexo para desktop e depois espremer ele no mobile, começamos pelas telas pequenas e vamos adicionando conteúdo para telas grandes.

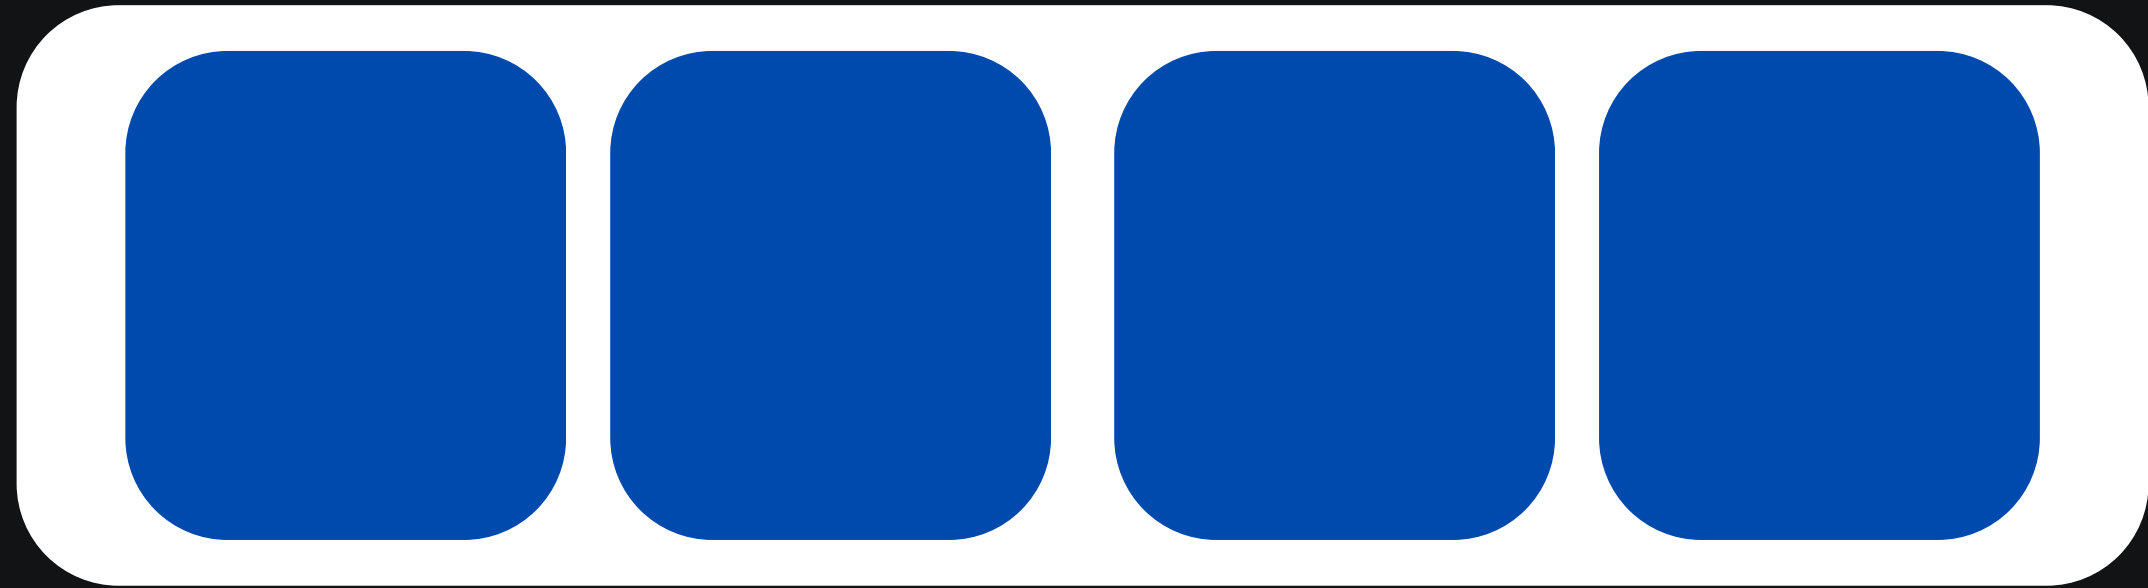

● Flexbox CSS

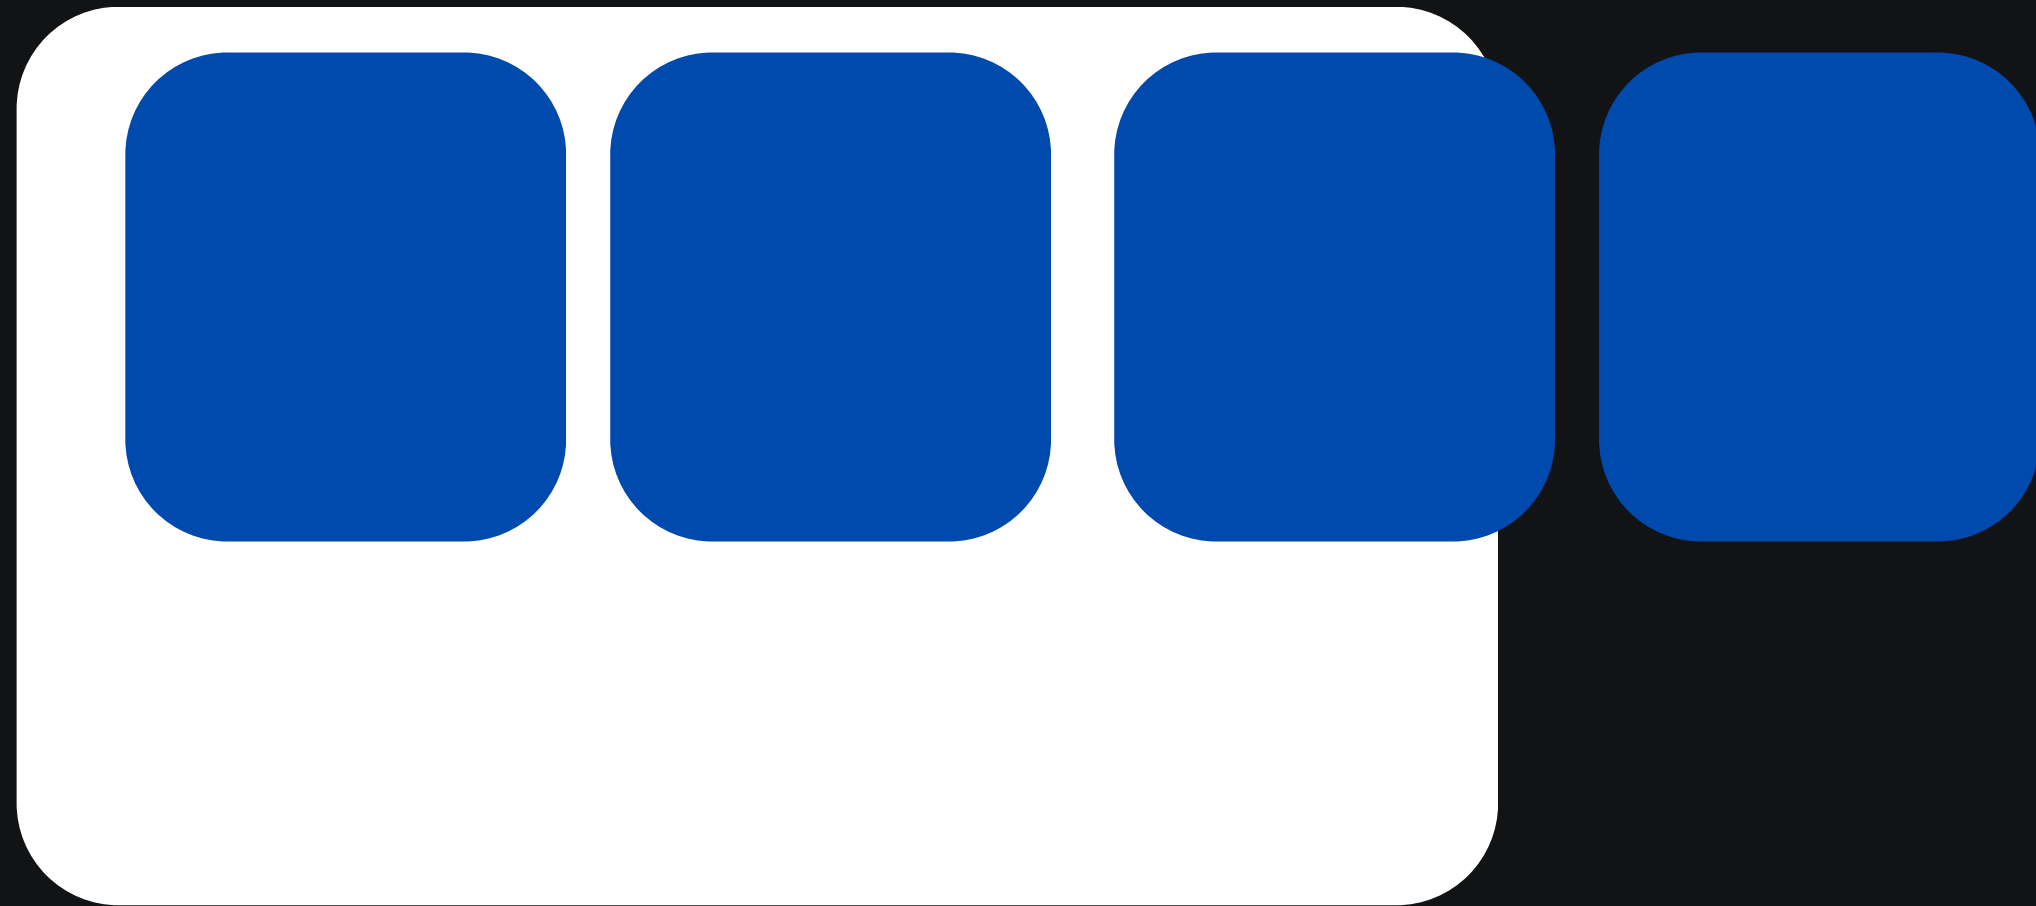

Flexible Box Module, ou simplesmente Flexbox, é um modelo de caixas flexíveis. Ele vai nos permitir criar muitos elementos que já vimos anteriormente, porém de forma muito mais flexível e adaptativa.

A ideia é que os elementos dentro de um container se adaptem automaticamente ao tamanho da página sem quebra-lá.

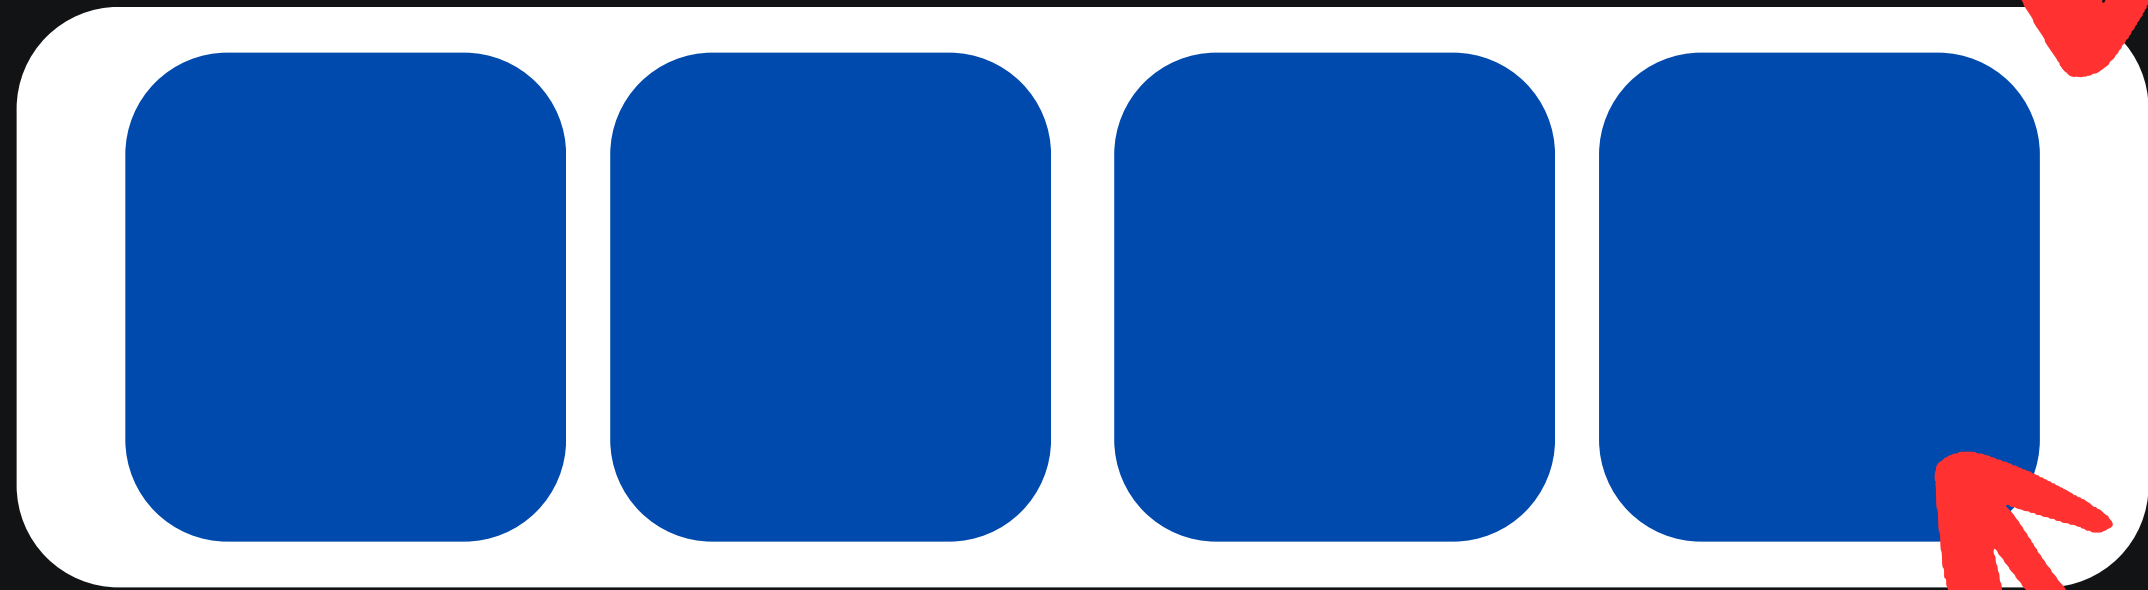

`display: inline-block;`

● Flexbox CSS

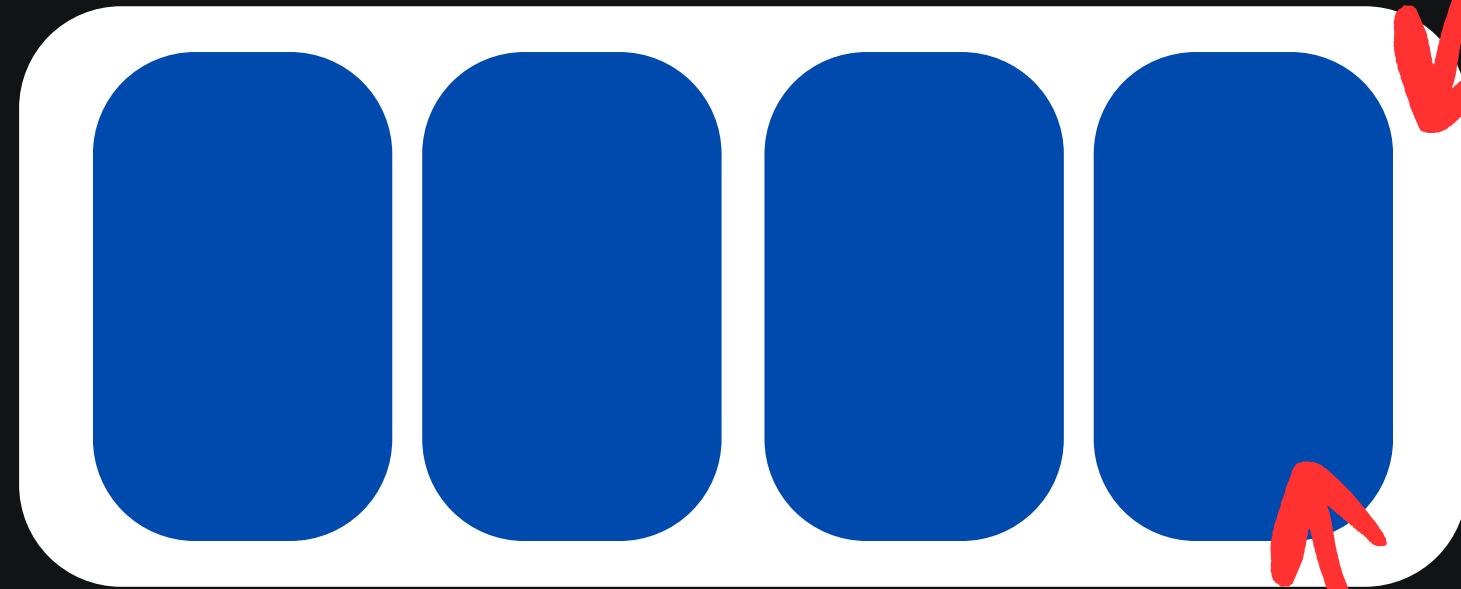

`display: flex;`

`flex: auto;`

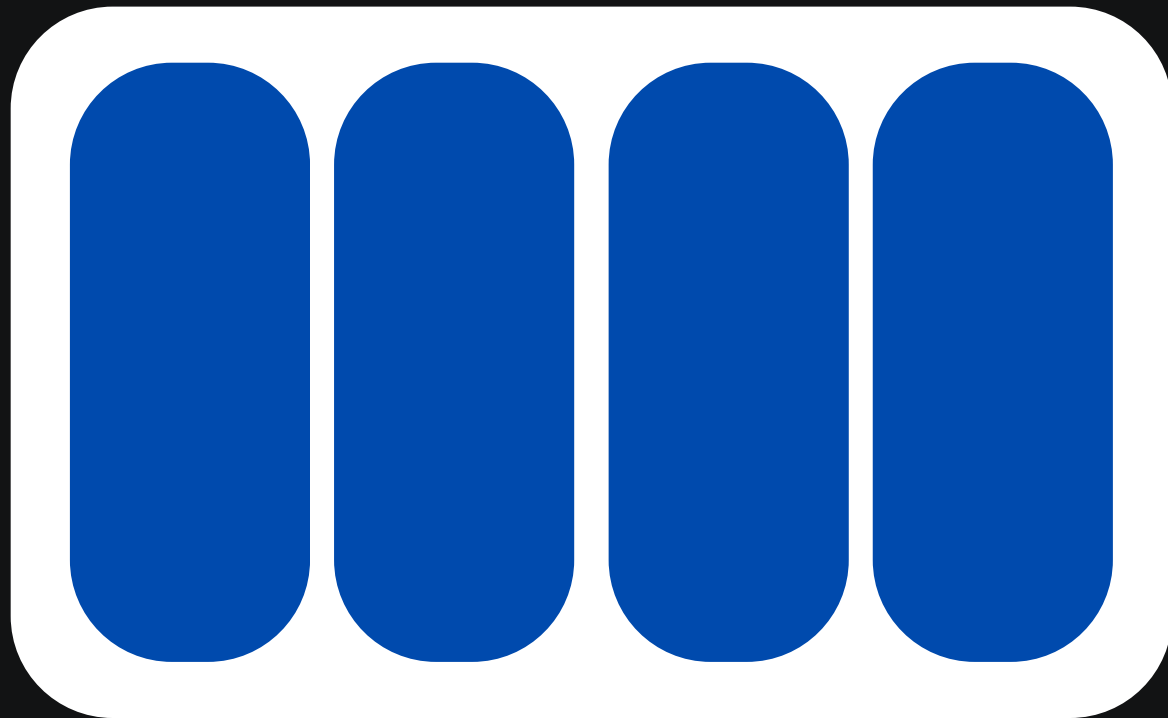

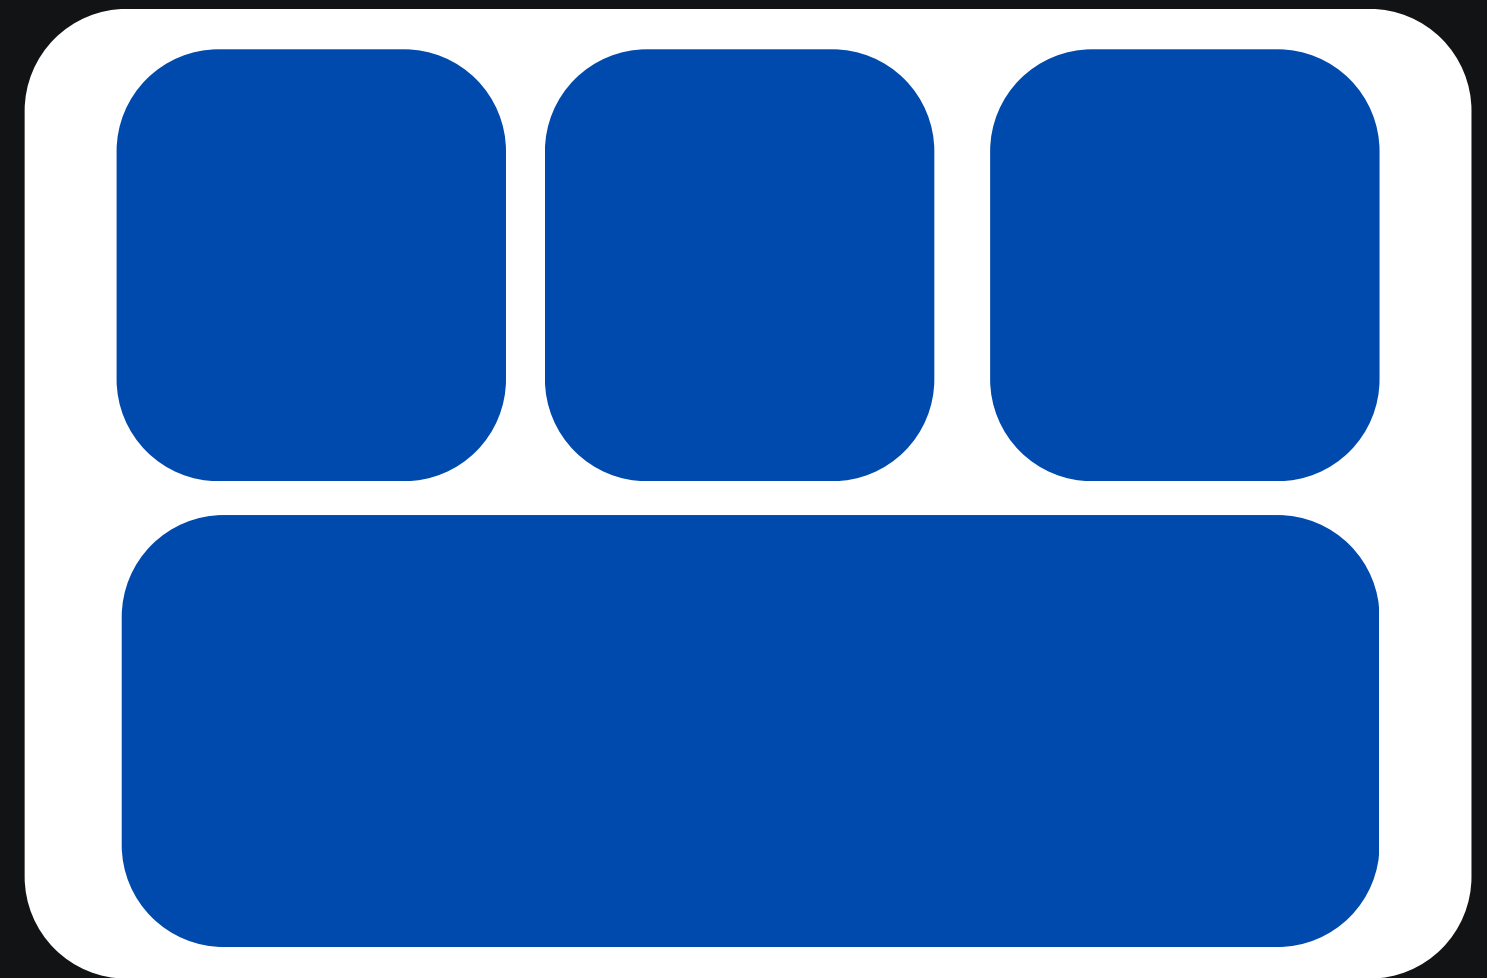

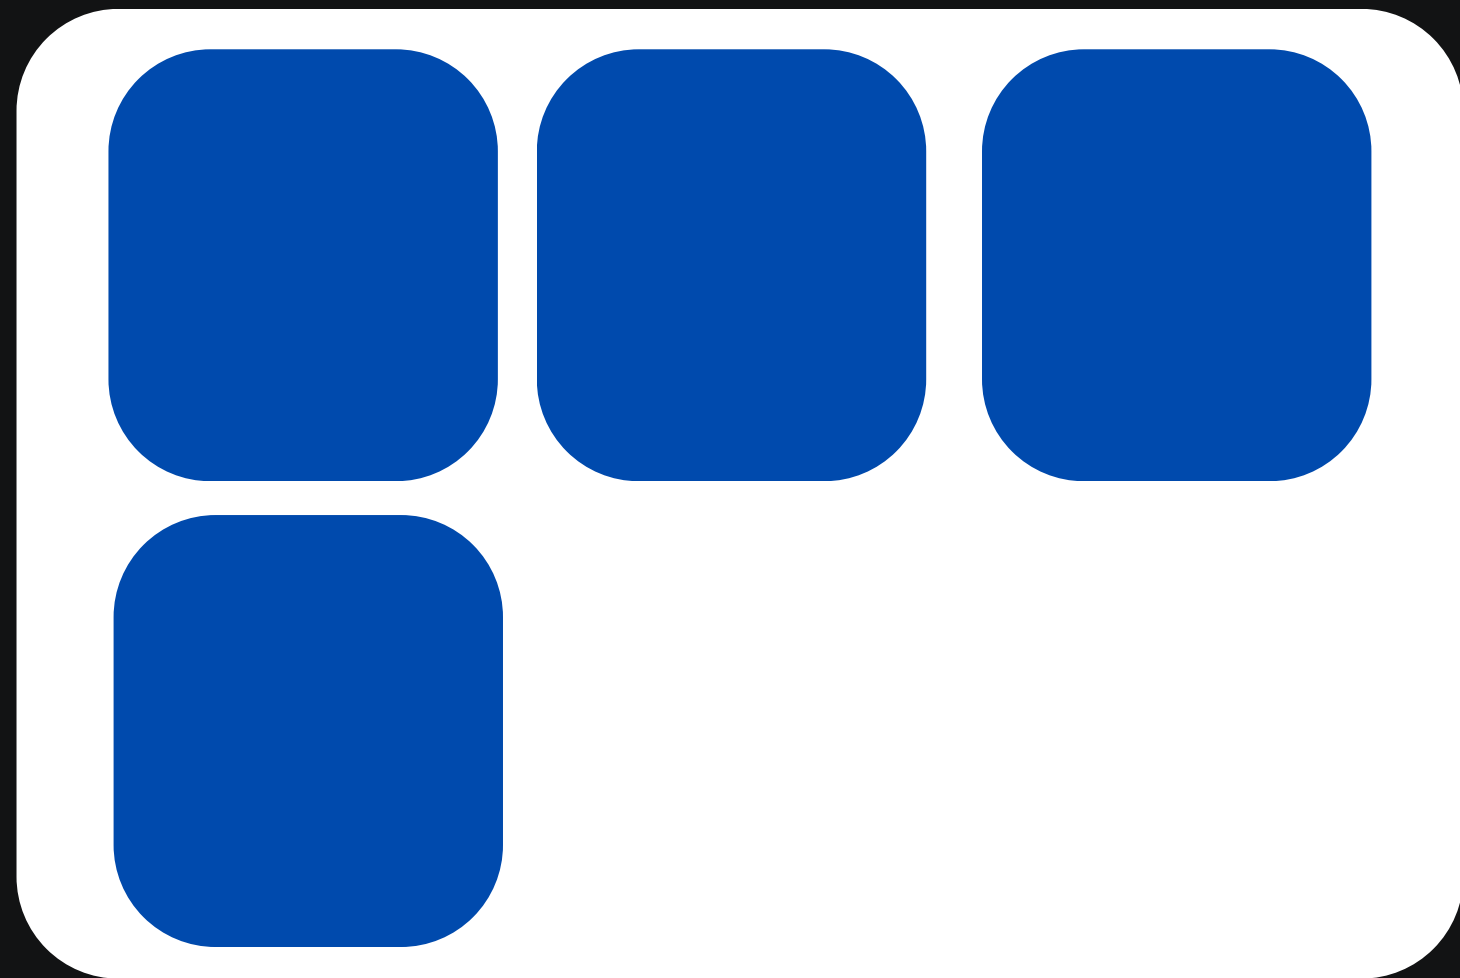

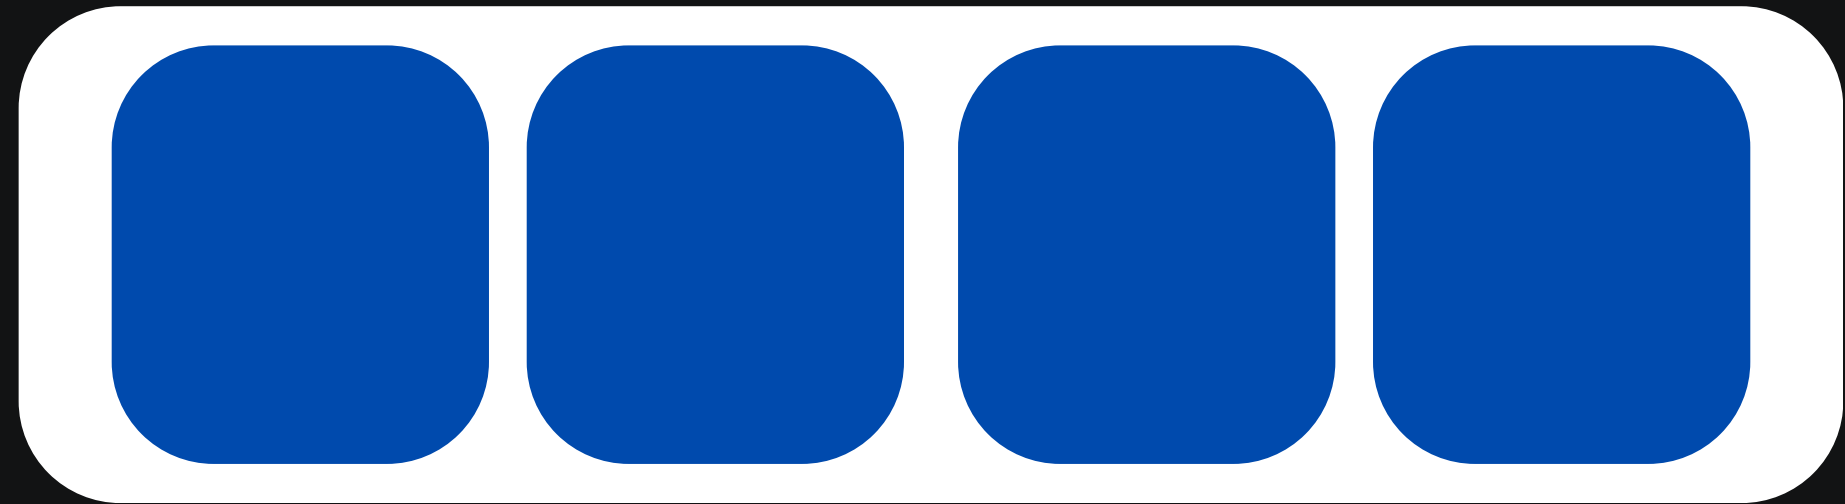

● Flexbox CSS

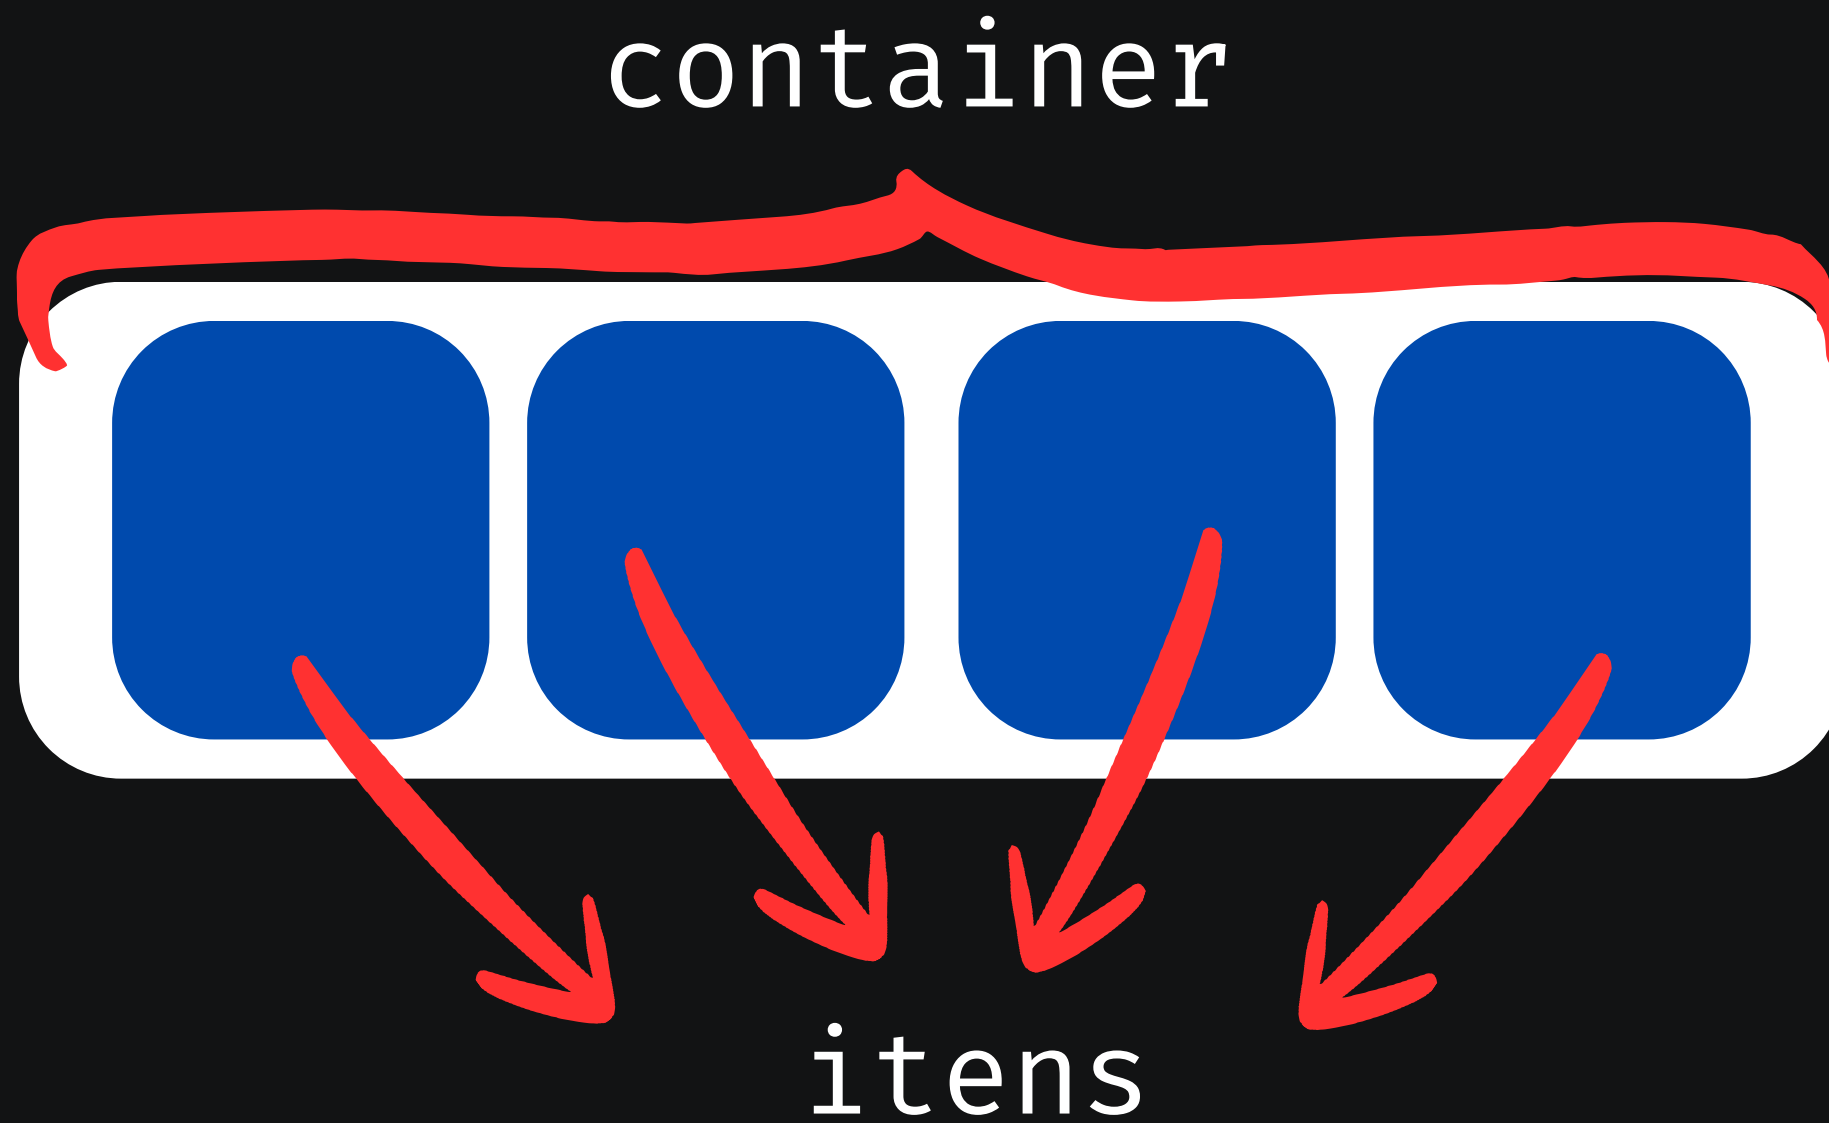

`display: flex;`

`flex: auto;`

● Flexbox CSS

```
div.container {  
  display: flex;  
}  
  
div.items {  
  flex: auto;  
}
```

● flex-direction

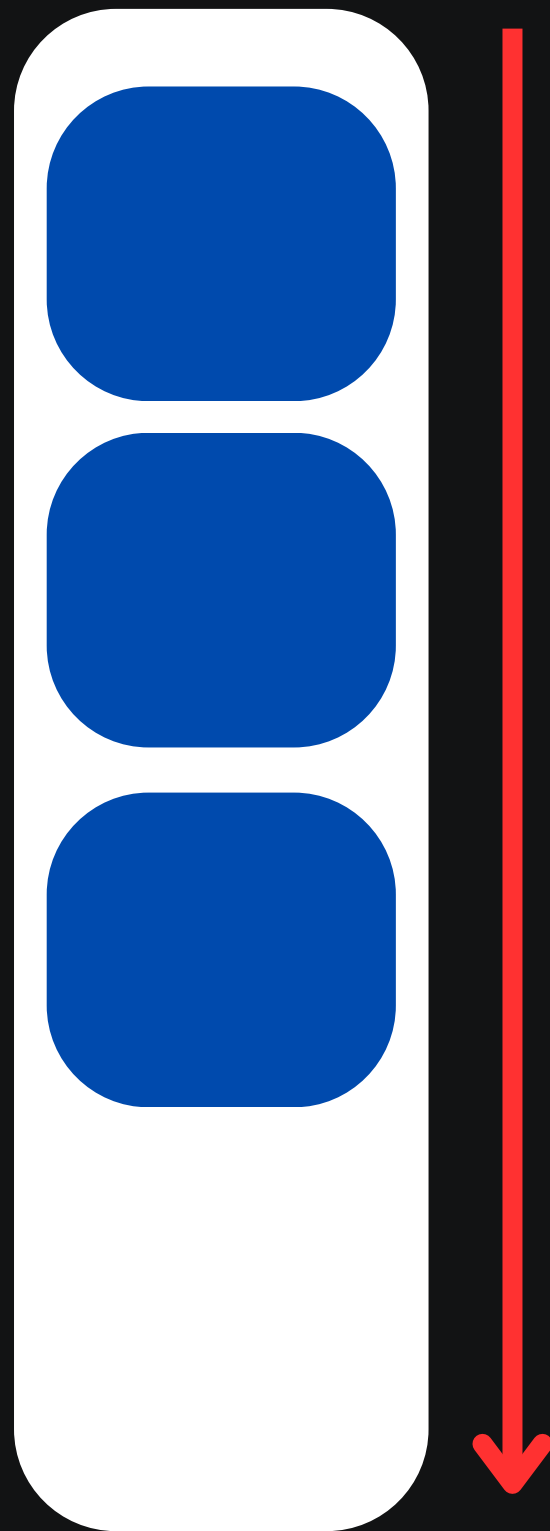

`flex-direction: row;`

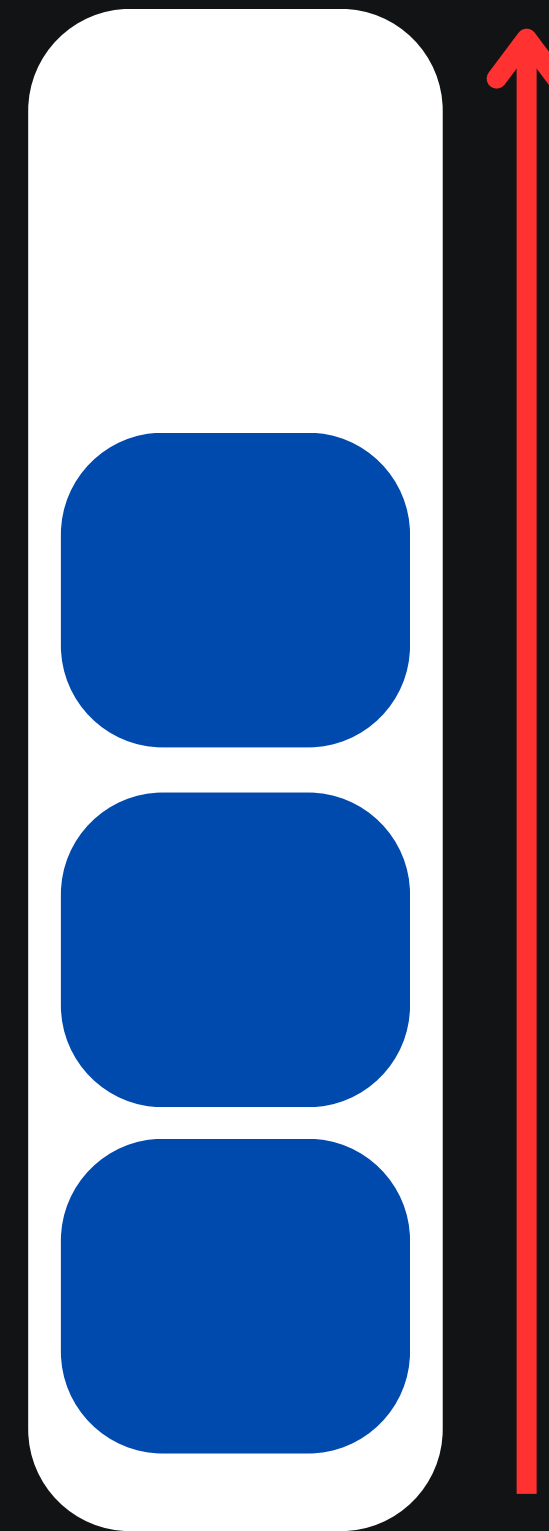

`flex-direction: row-reverse;`

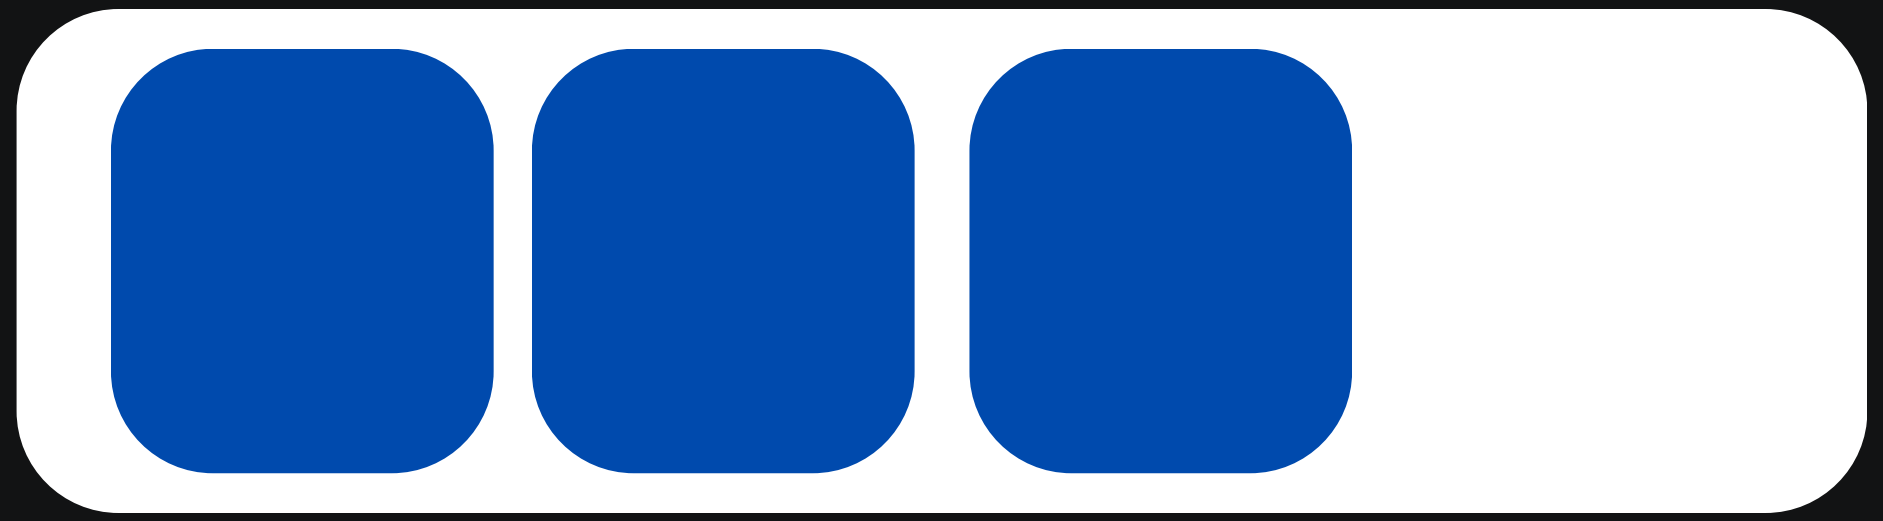

● flex-direction

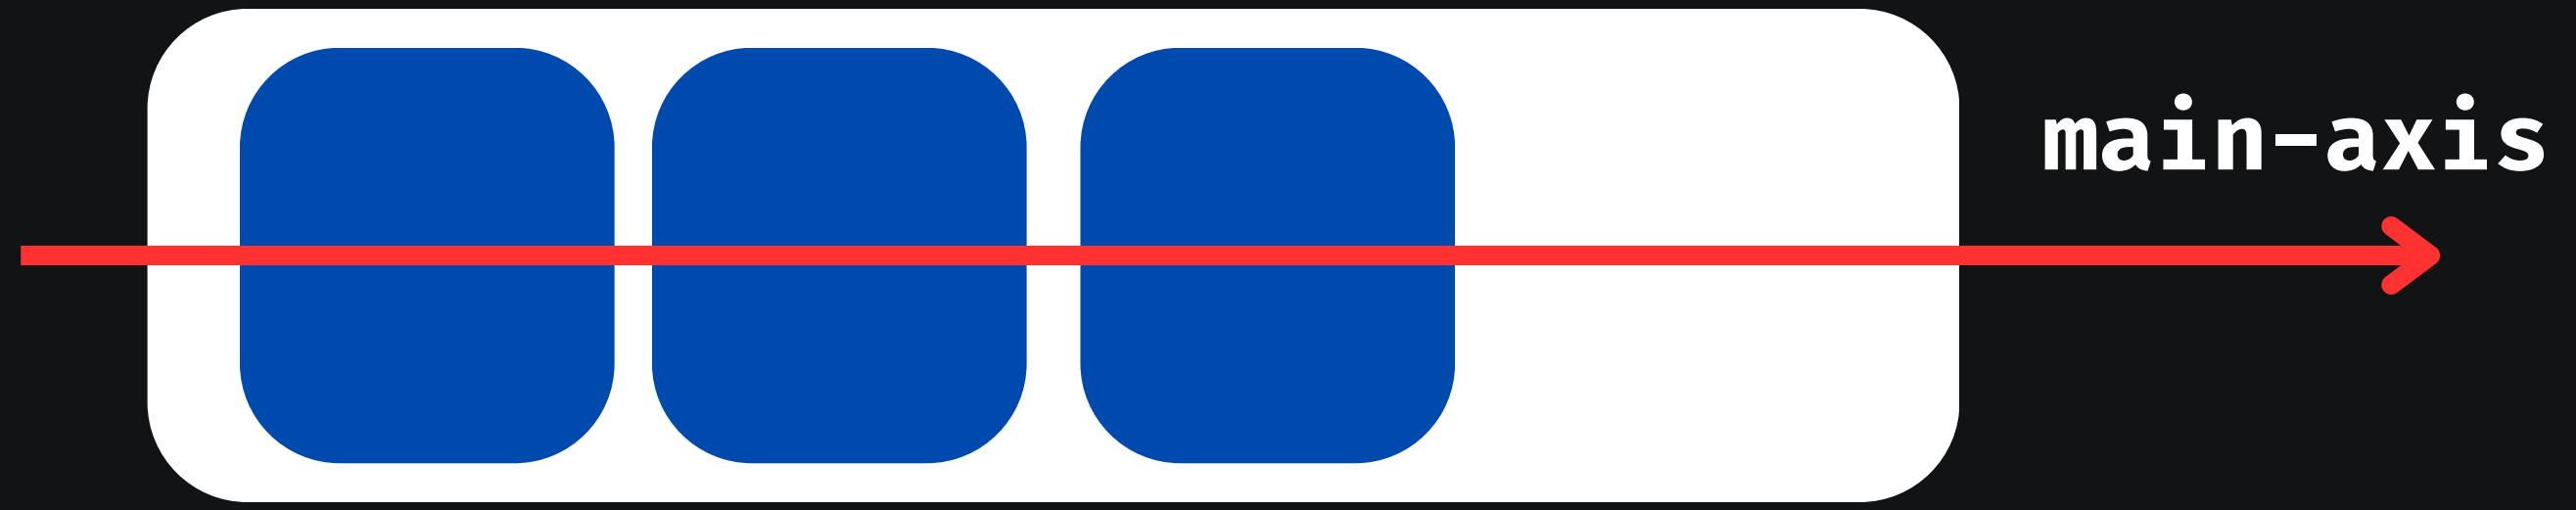

flex-direction: column;

flex-direction: column-reverse;

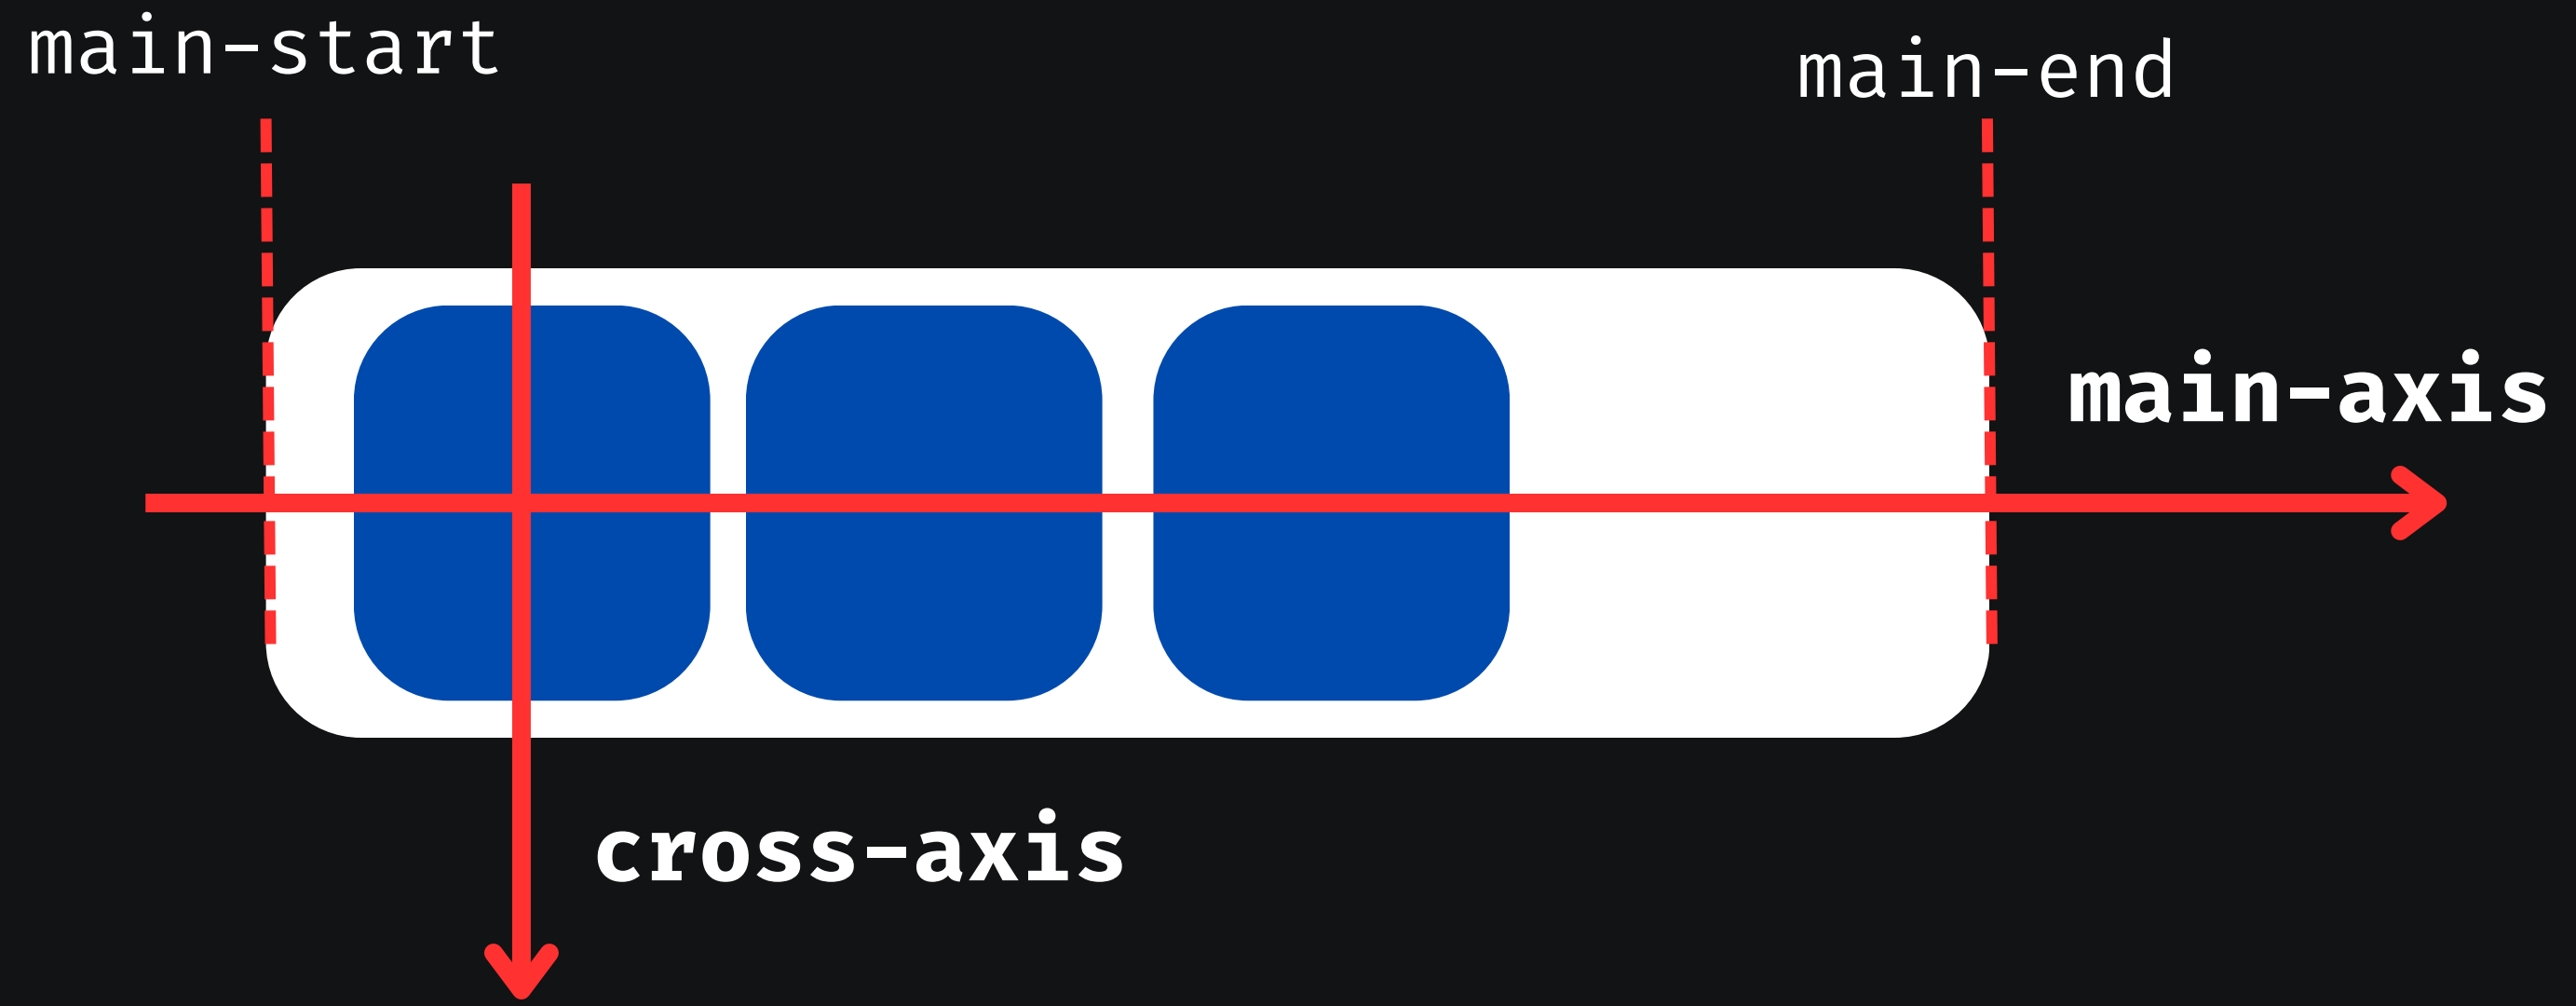

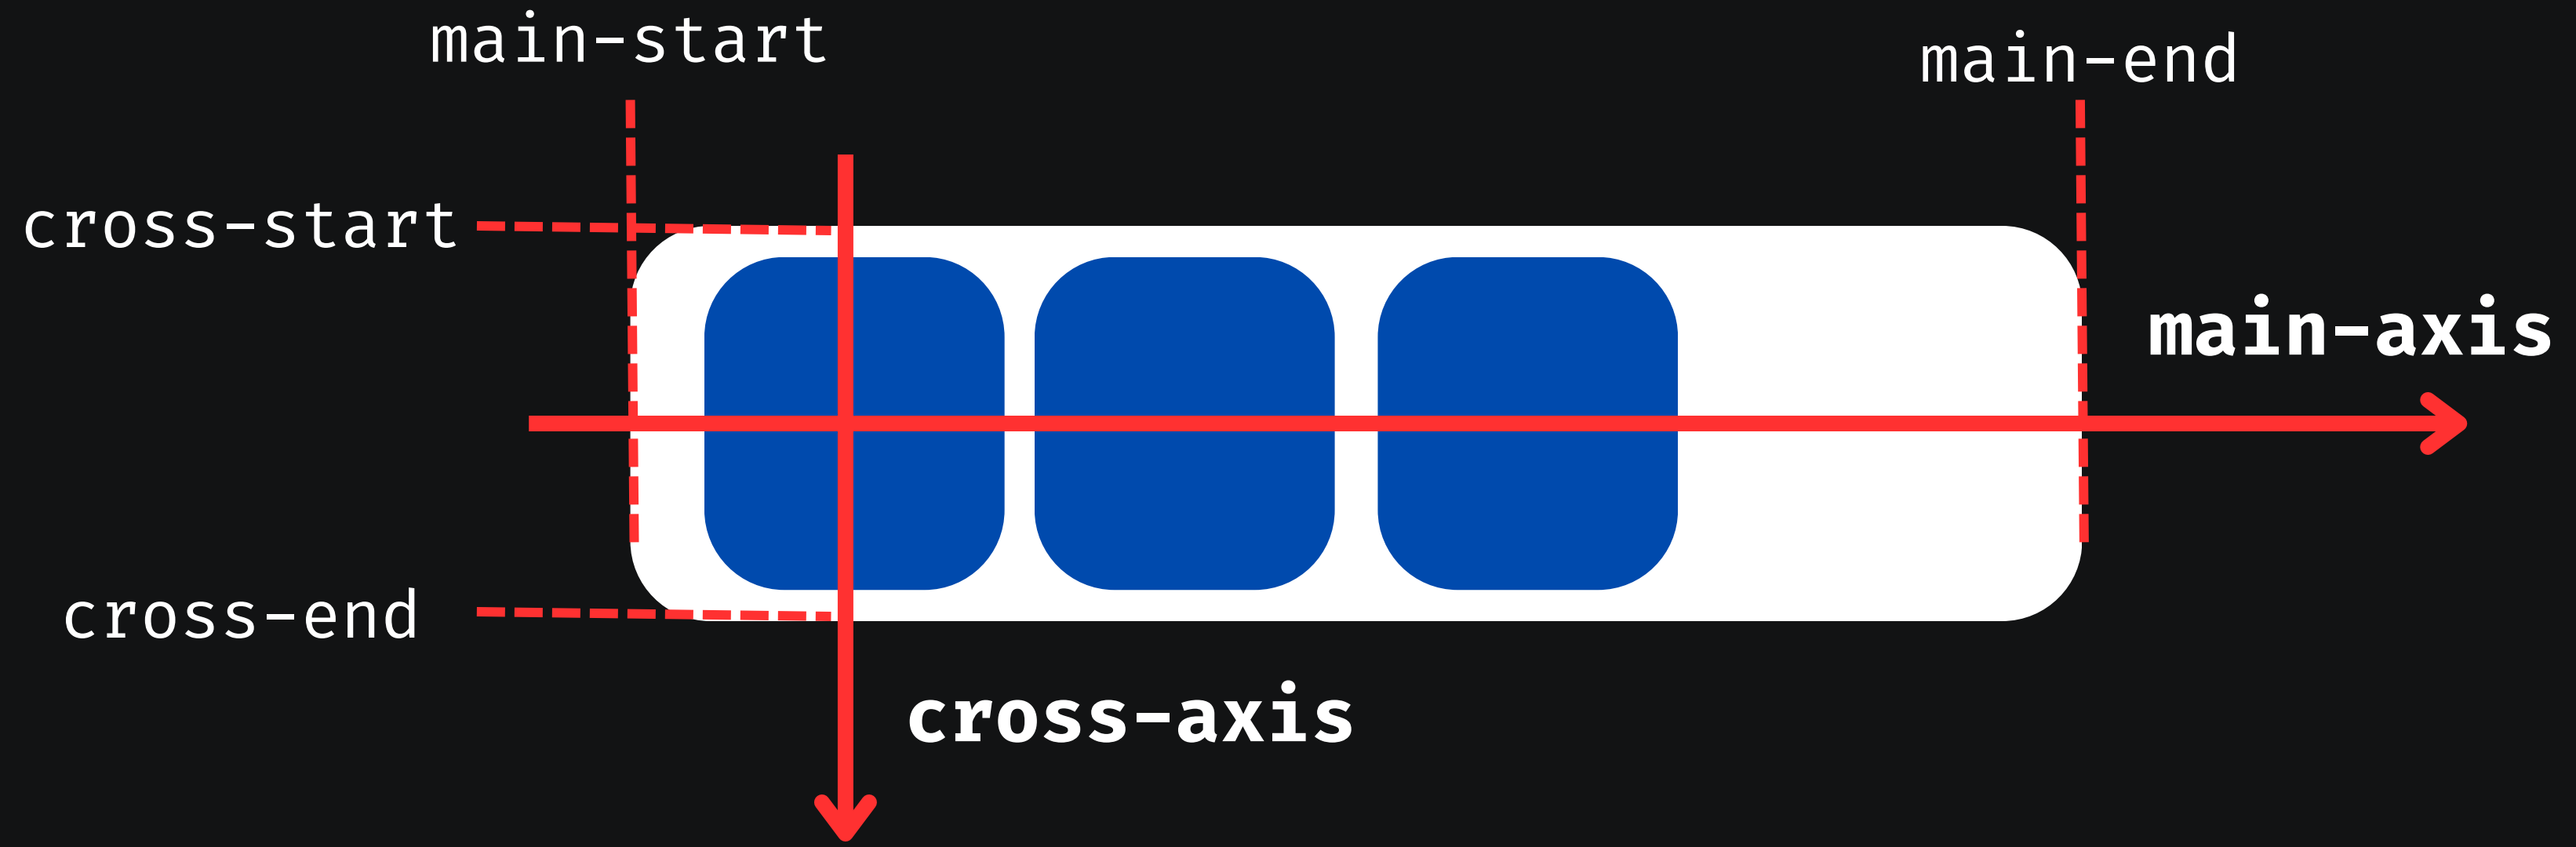

main-start

main-end

main-axis

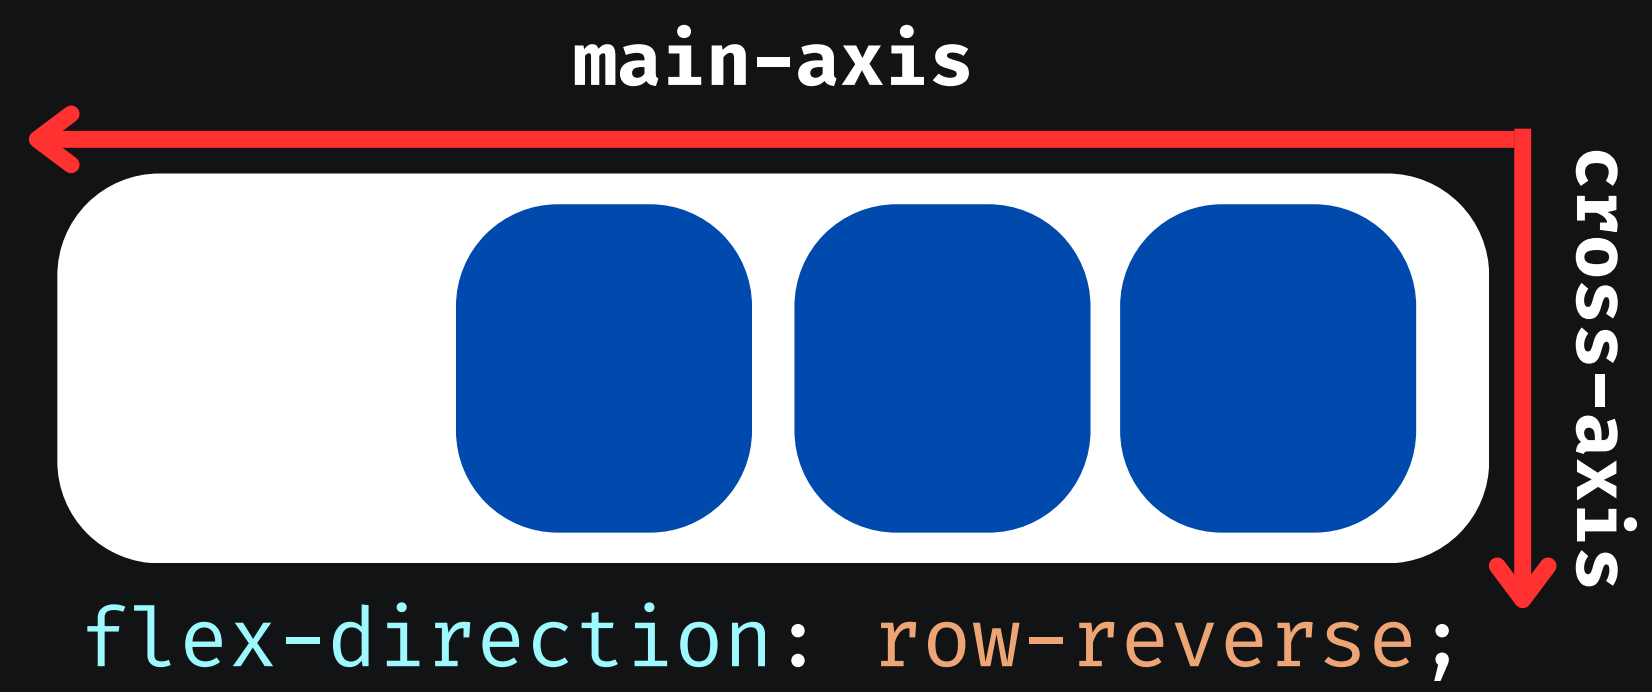

● Eixos (axis)

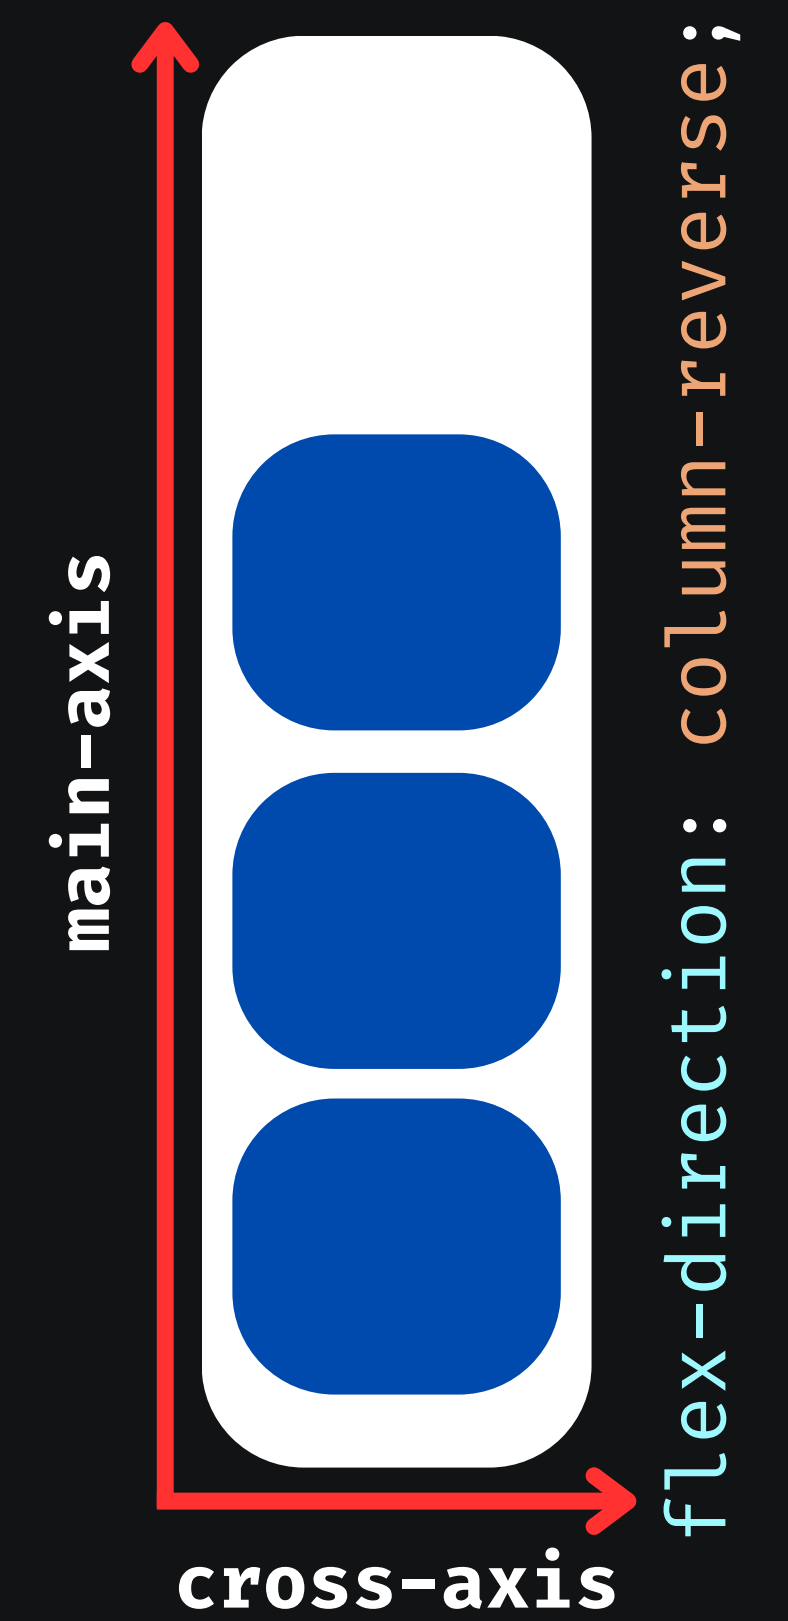

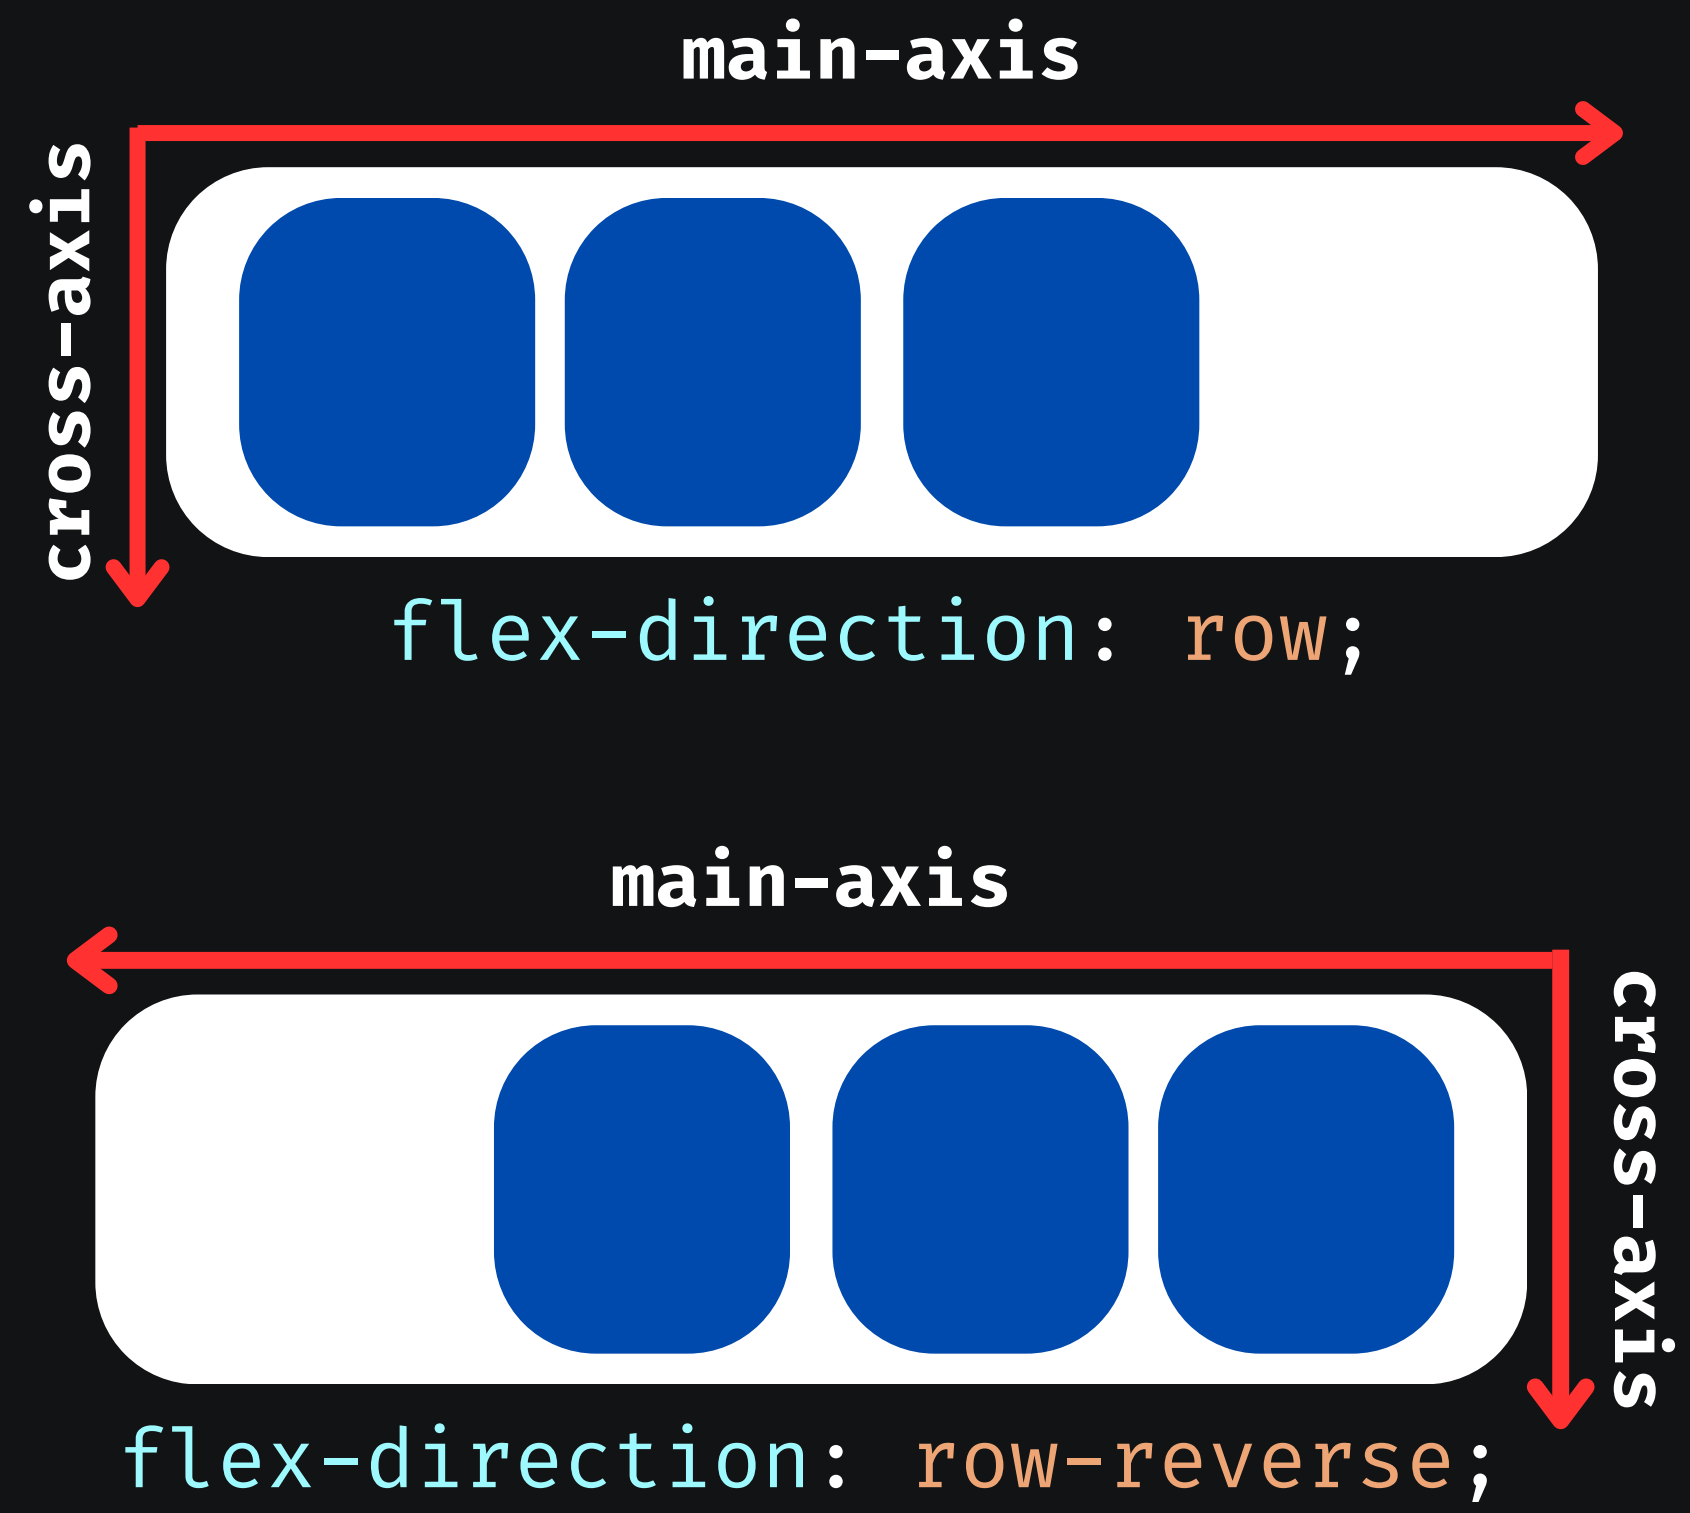

● Eixos (axis)

● Eixos (axis)

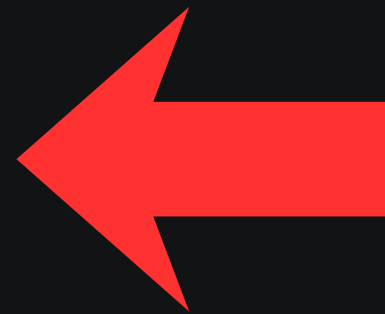

● Eixos (axis)

● flex-wrap

`flex-wrap: nowrap;`

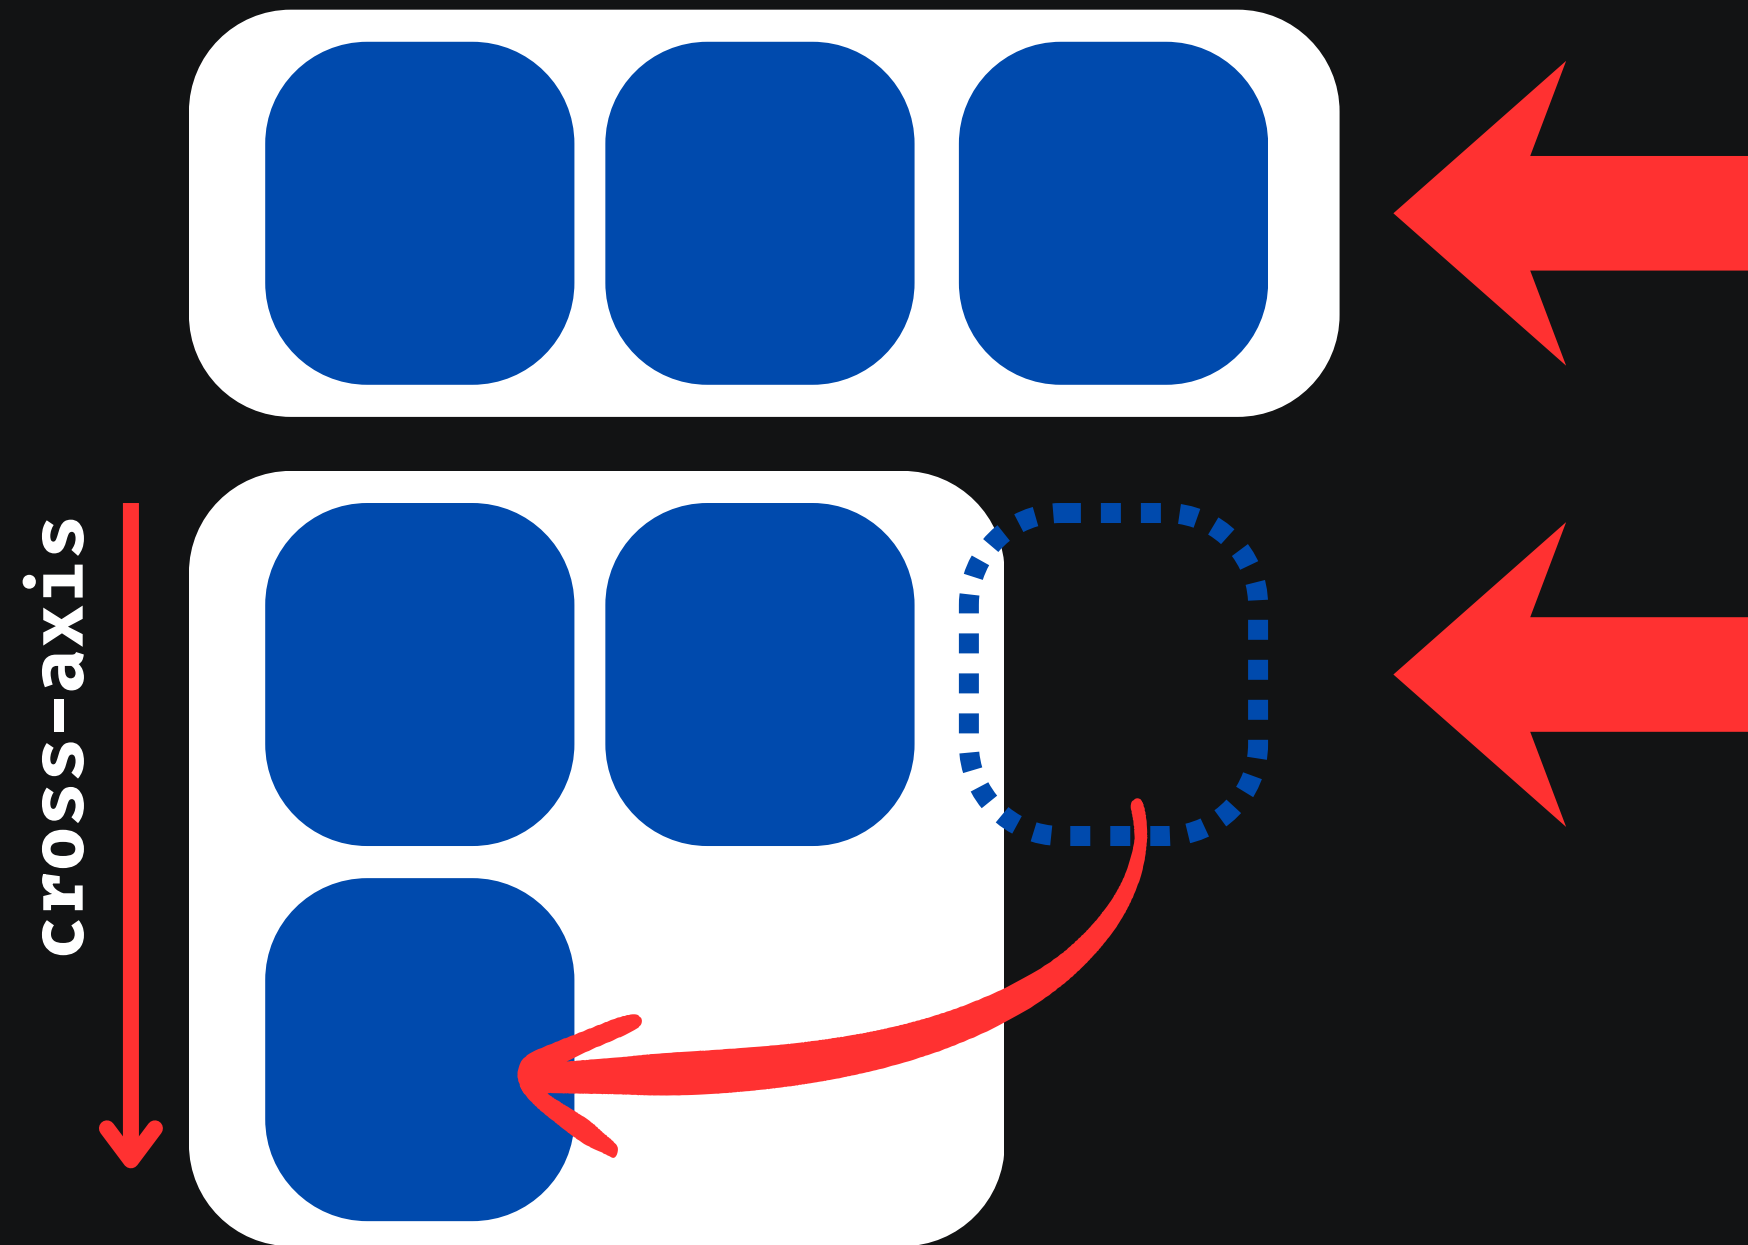

No CSS **wrap** significa “quebrar linha” ou “ajustar”, com no wrap os elementos permanecem juntos na mesma linha (eixo principal) até que o conteúdo não caiba mais. Por padrão o nowrap já vem ativado.

● flex-wrap

`flex-wrap: wrap;`

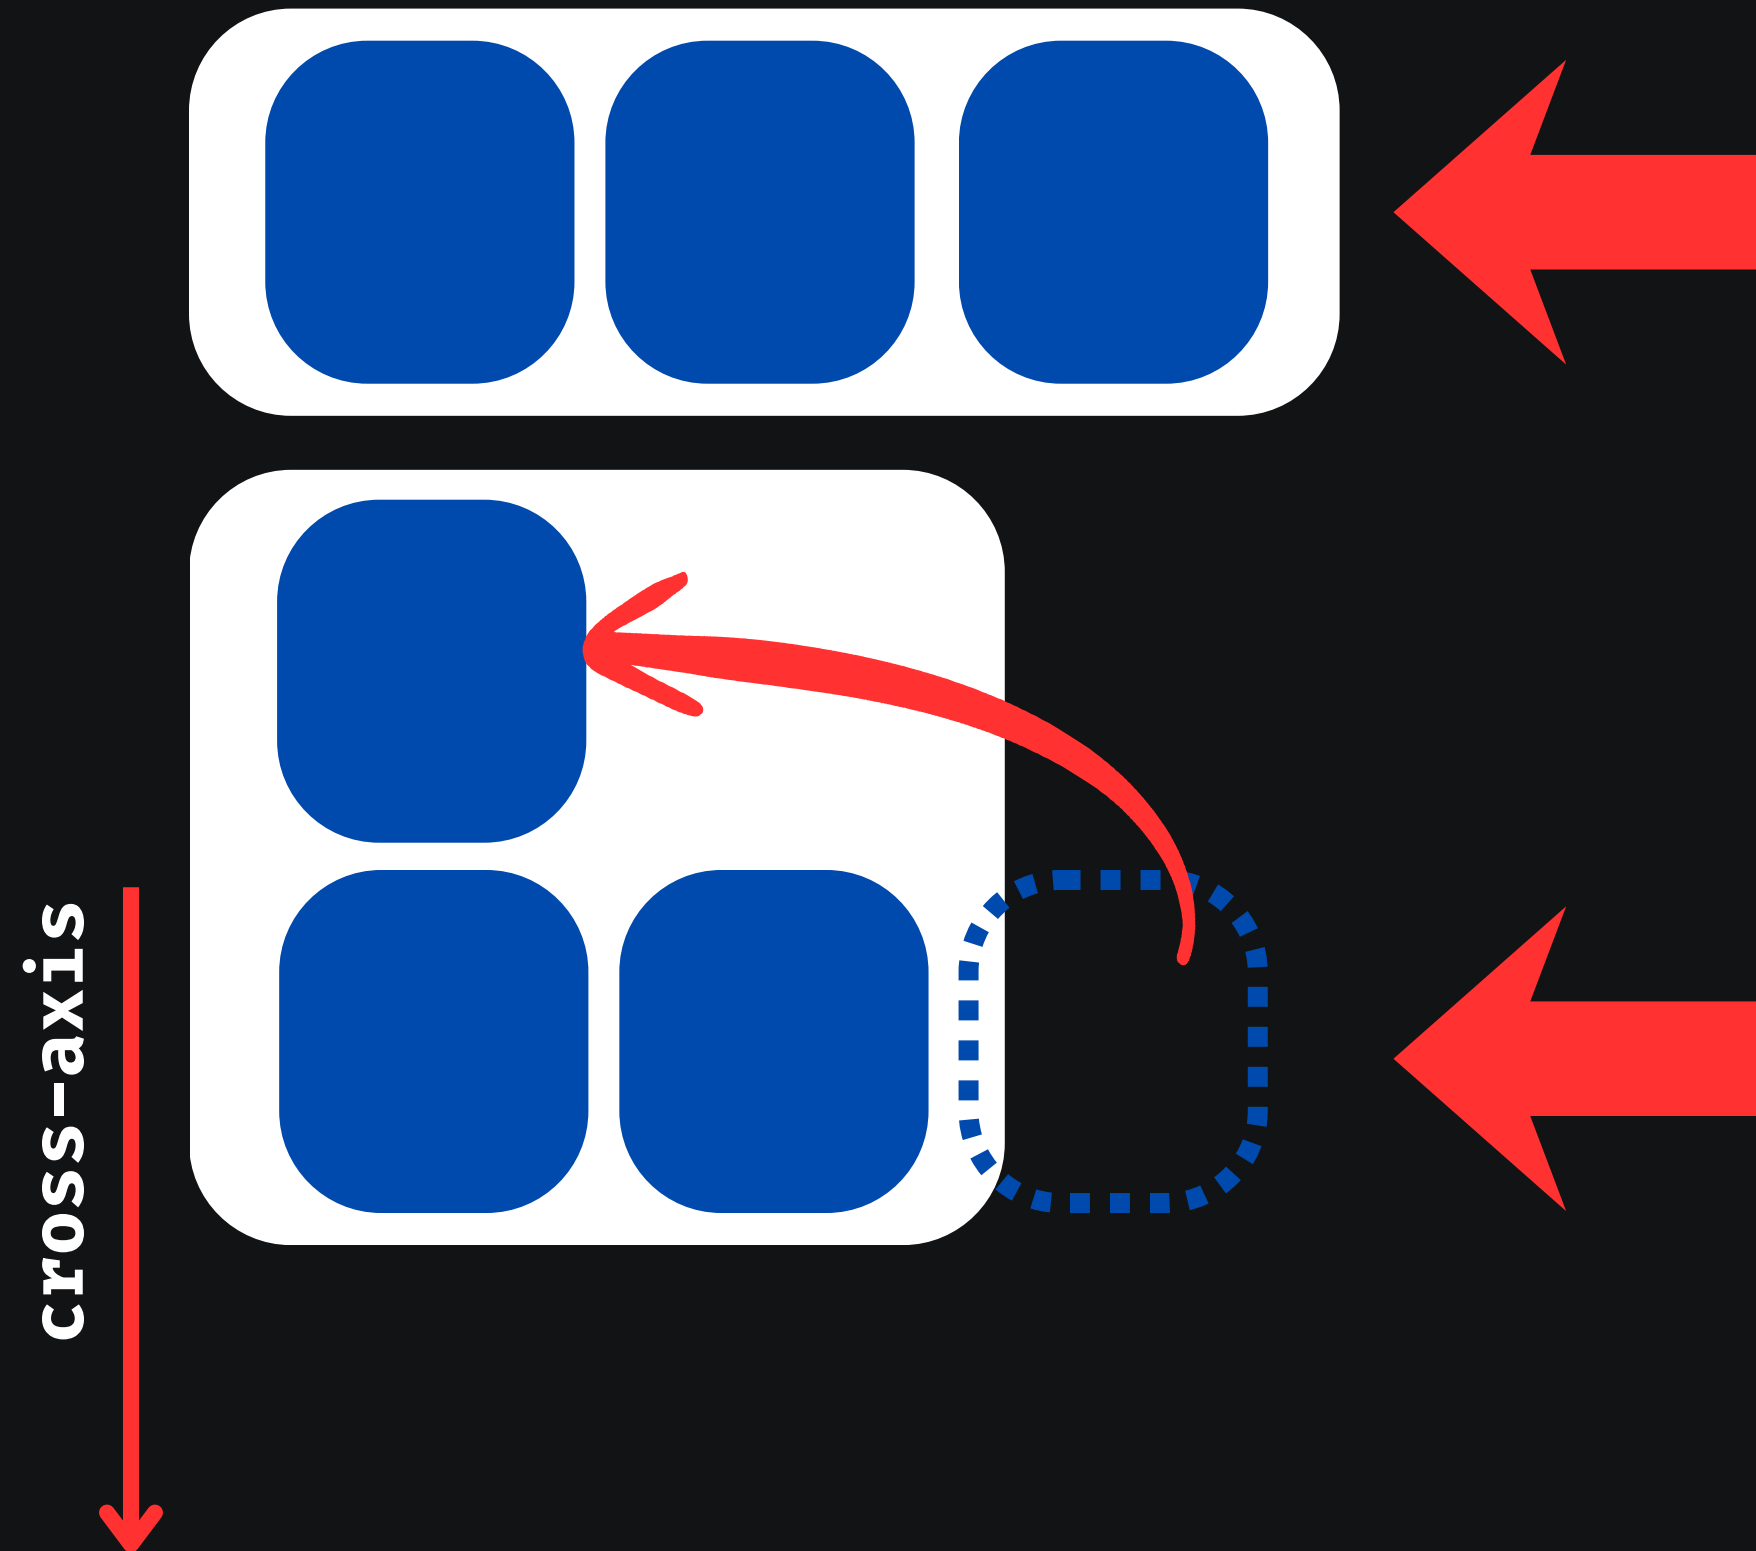

Com o **wrap** ativado o elemento muda a posição, seguindo a orientação do **cross-axis**.

● flex-wrap

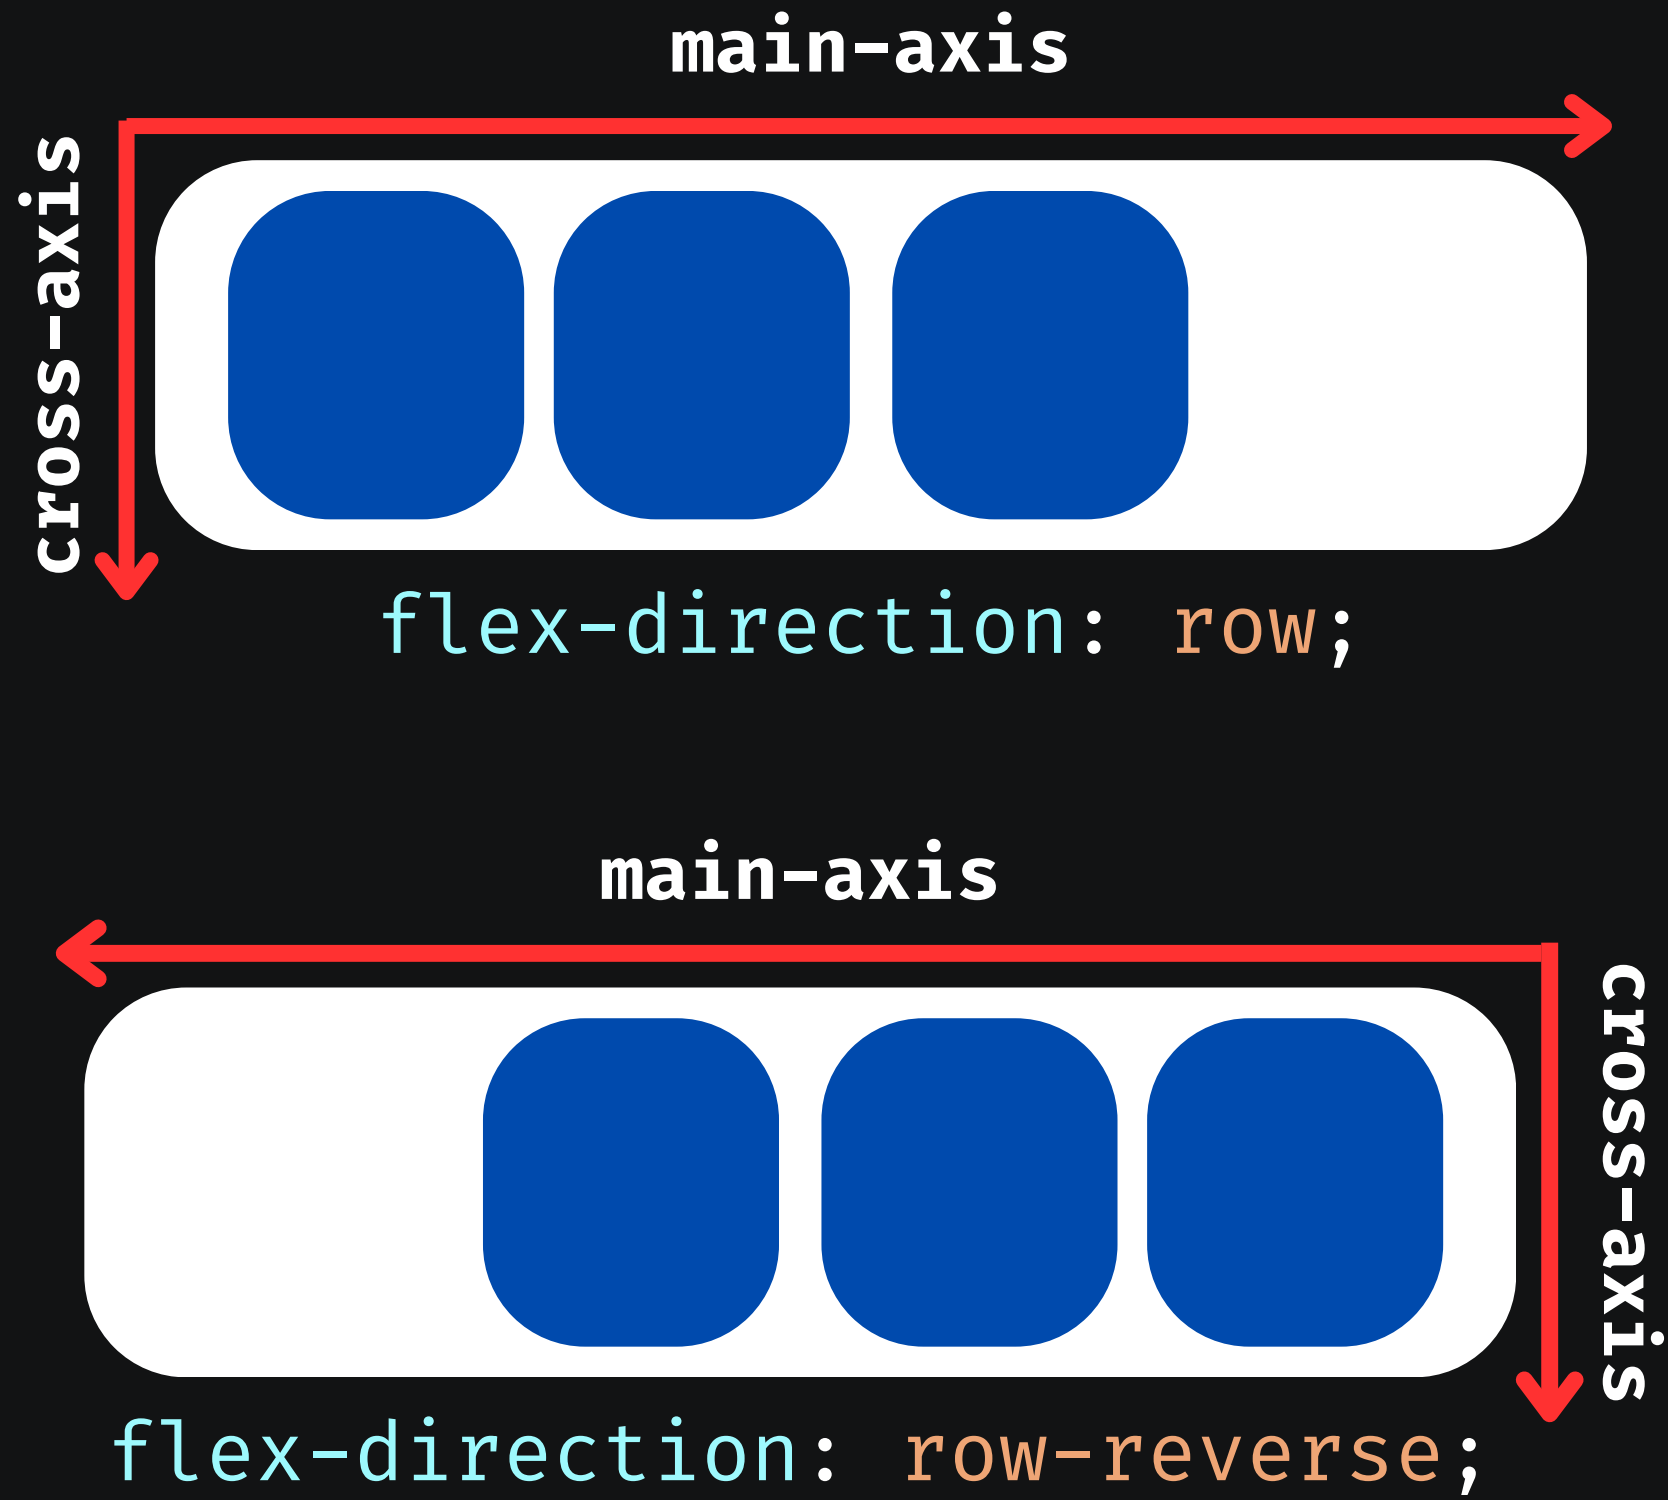

`flex-wrap: wrap-reverse;`

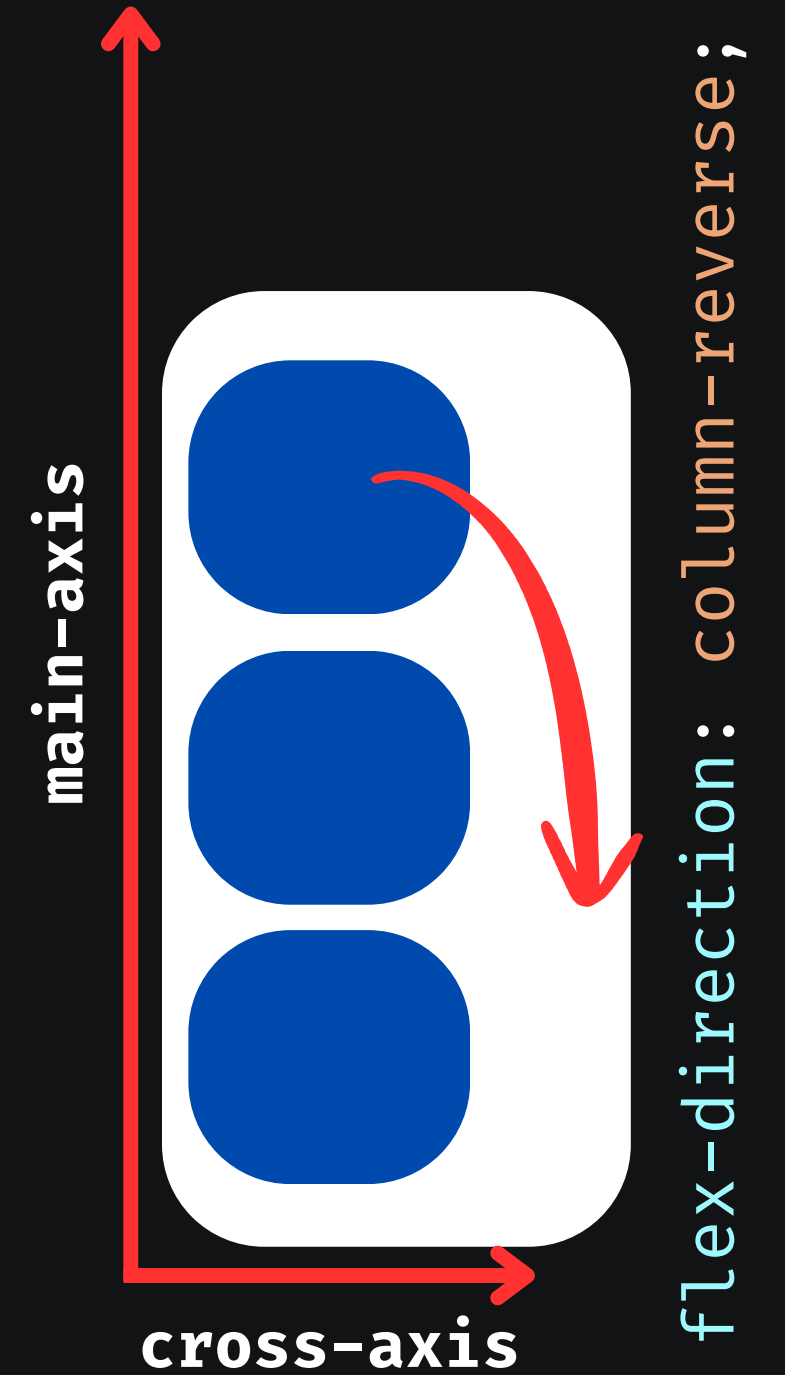

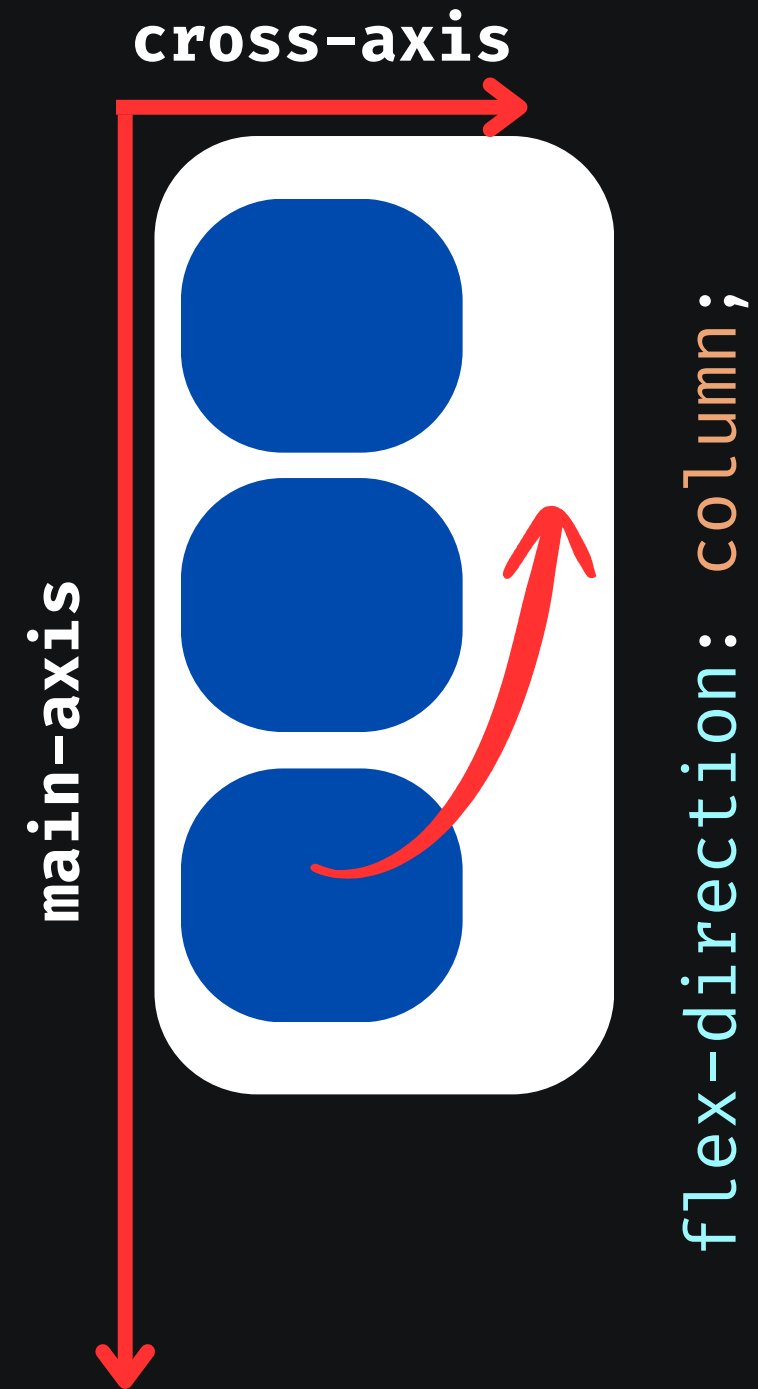

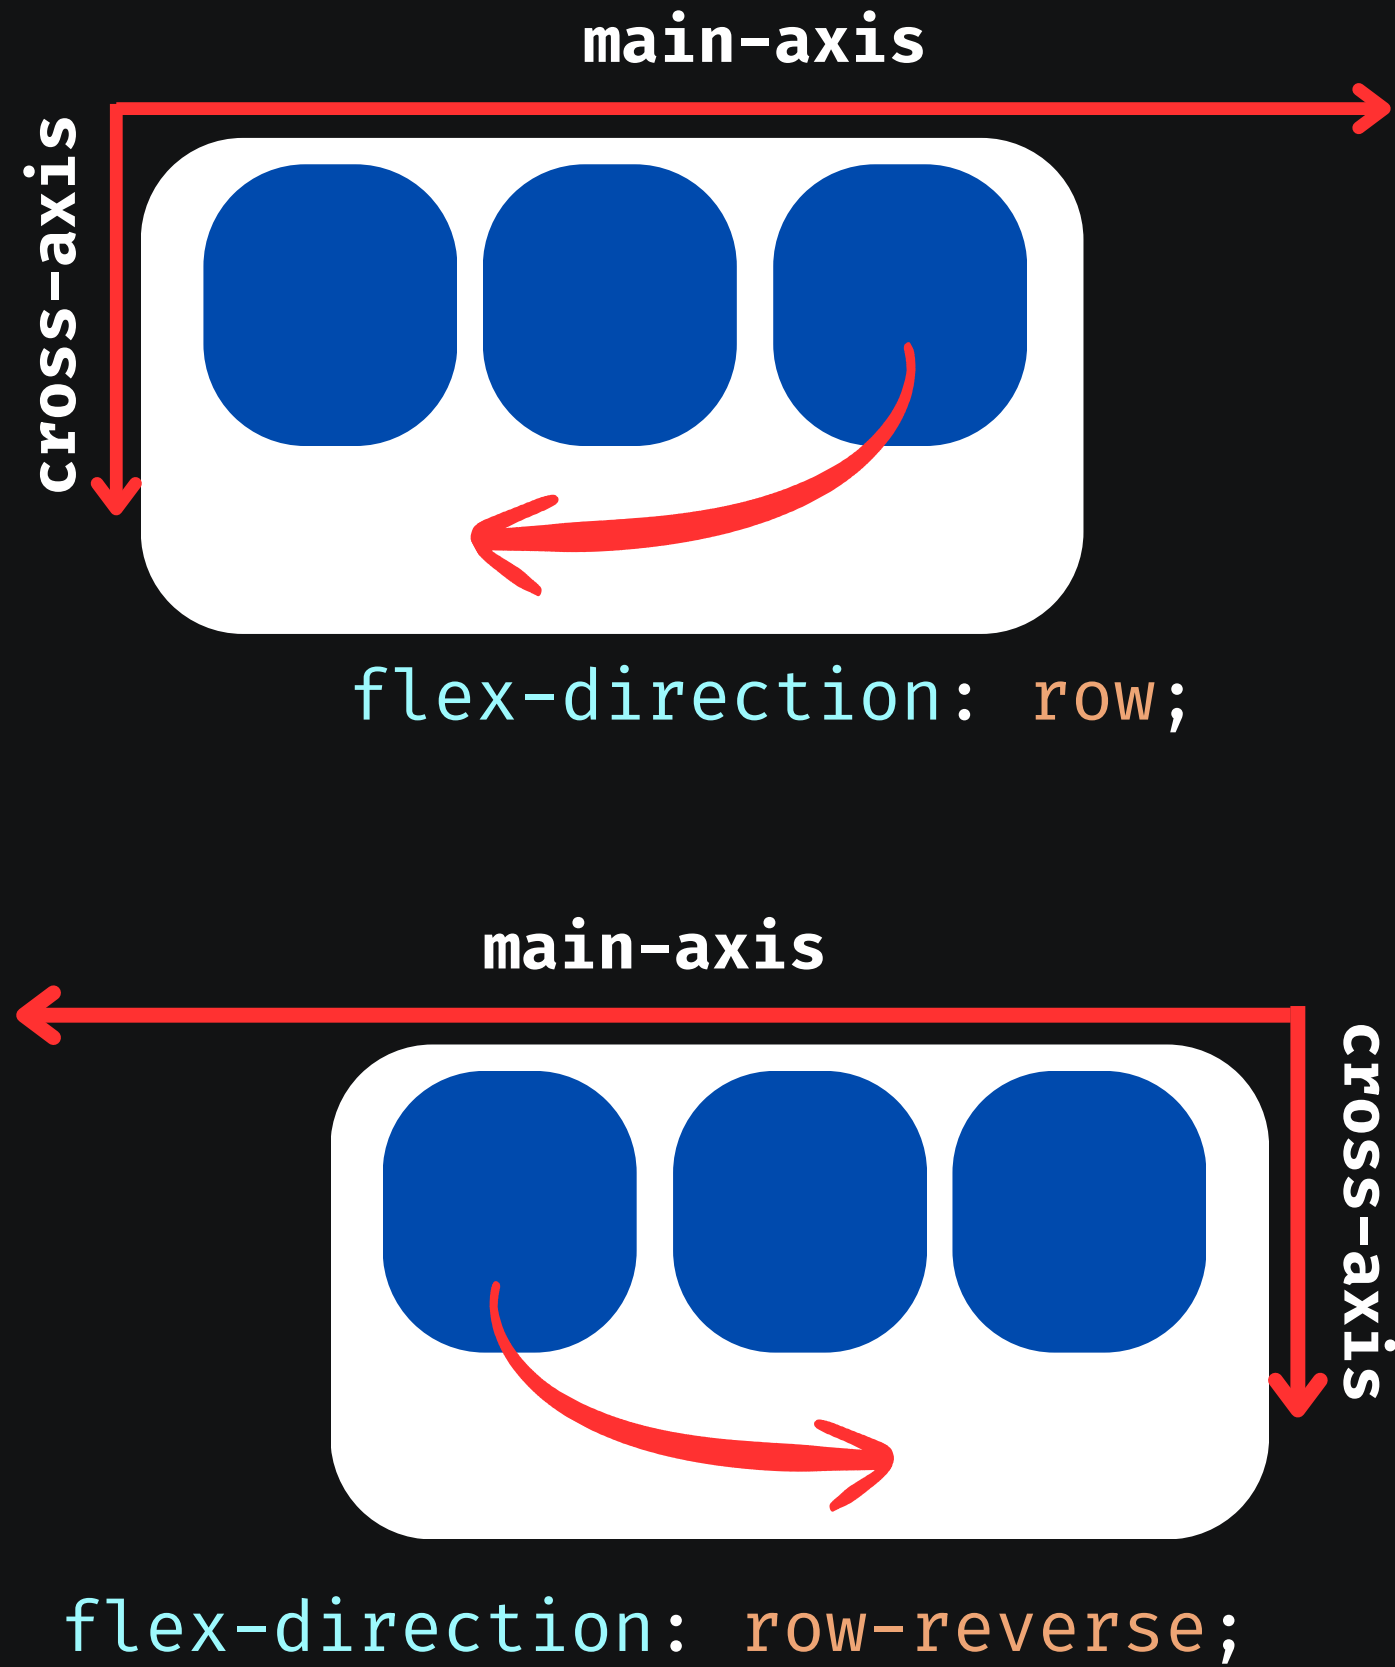

Com o **wrap-reverse** ativado o elemento também muda, mas dessa vez seguindo a orientação contrária ao **cross-axis**

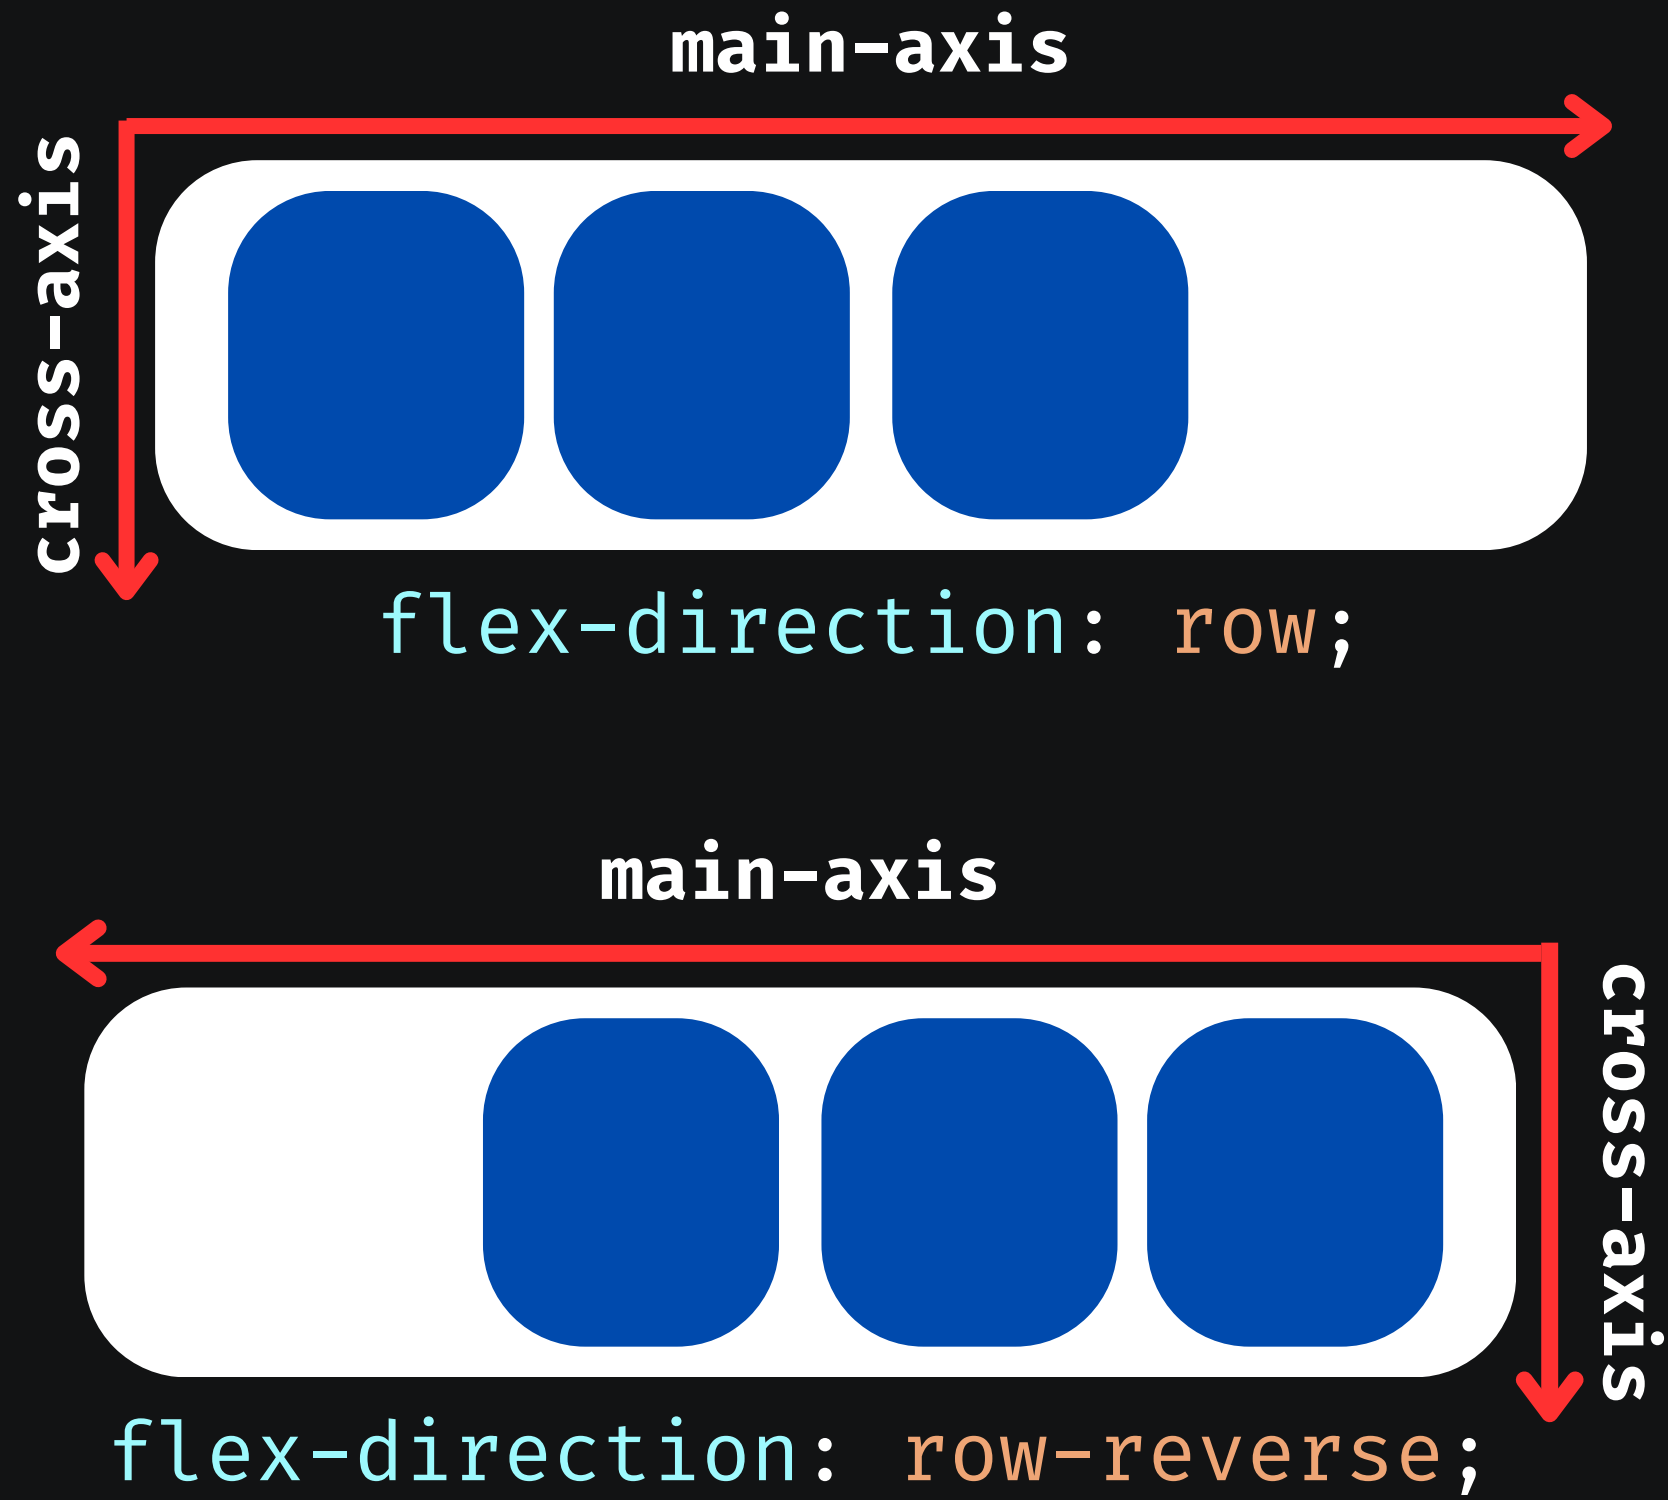

● flex-wrap: wrap

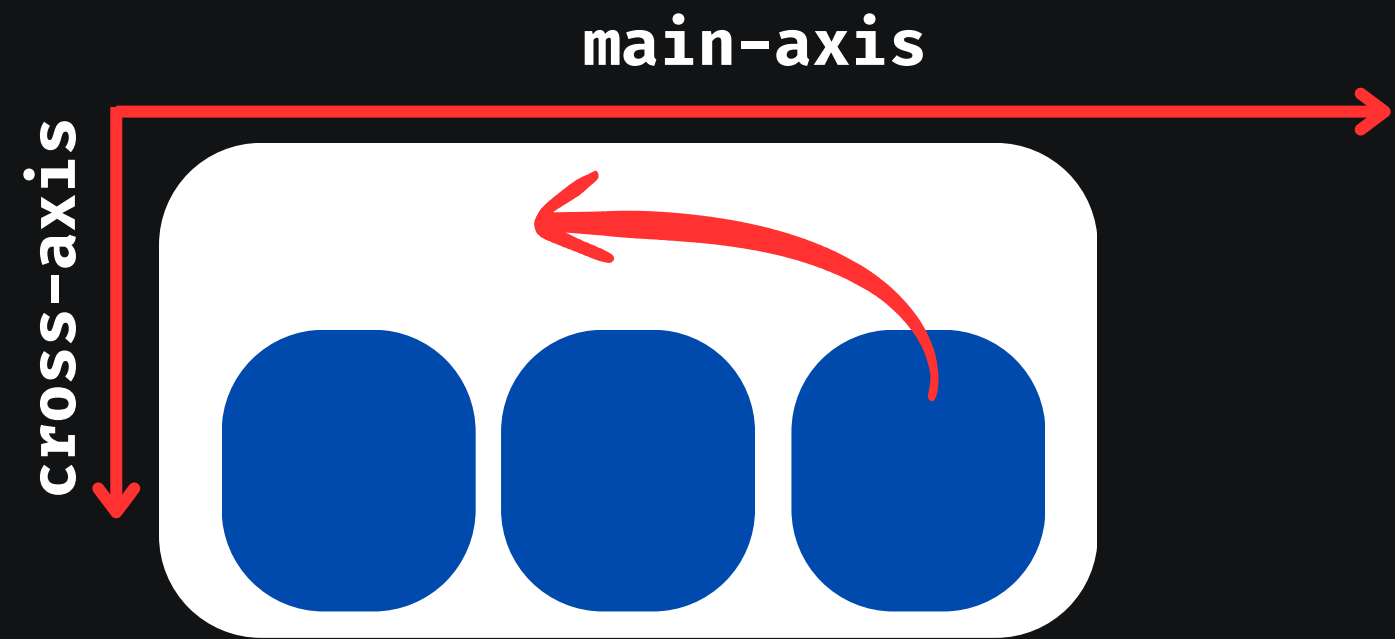

● flex-wrap: wrap

● flex-wrap: wrap-reverse

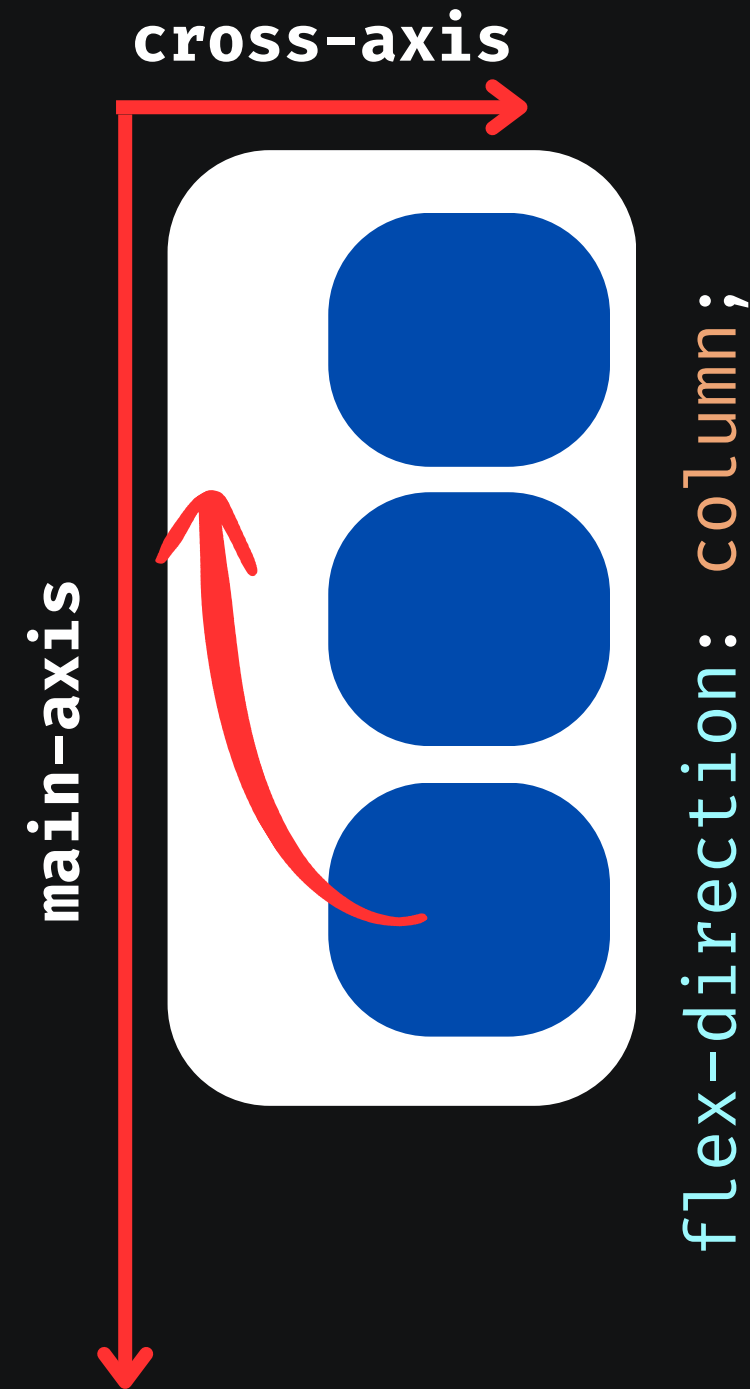

● flex-wrap: wrap-reverse

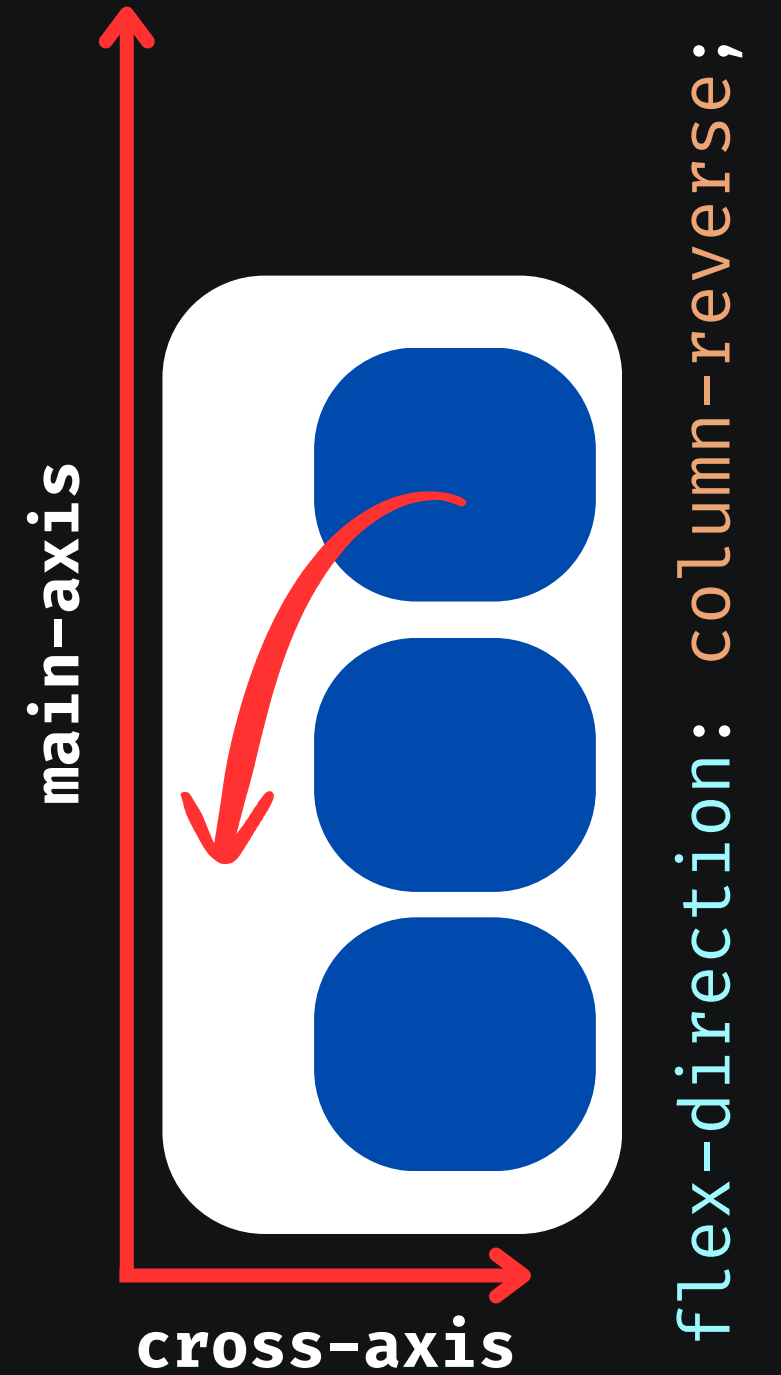

flex-direction: row;

flex-direction: row-reverse;

flex-direction: column;

flex-direction: column-reverse;

flex-direction + flex-wrap

```
flex-direction: row;  
flex-wrap: nowrap;
```

```
} flex-flow: row nowrap;
```

● justify-content:

Posicionar os itens com relação ao main-axis

● justify-content: flex-start

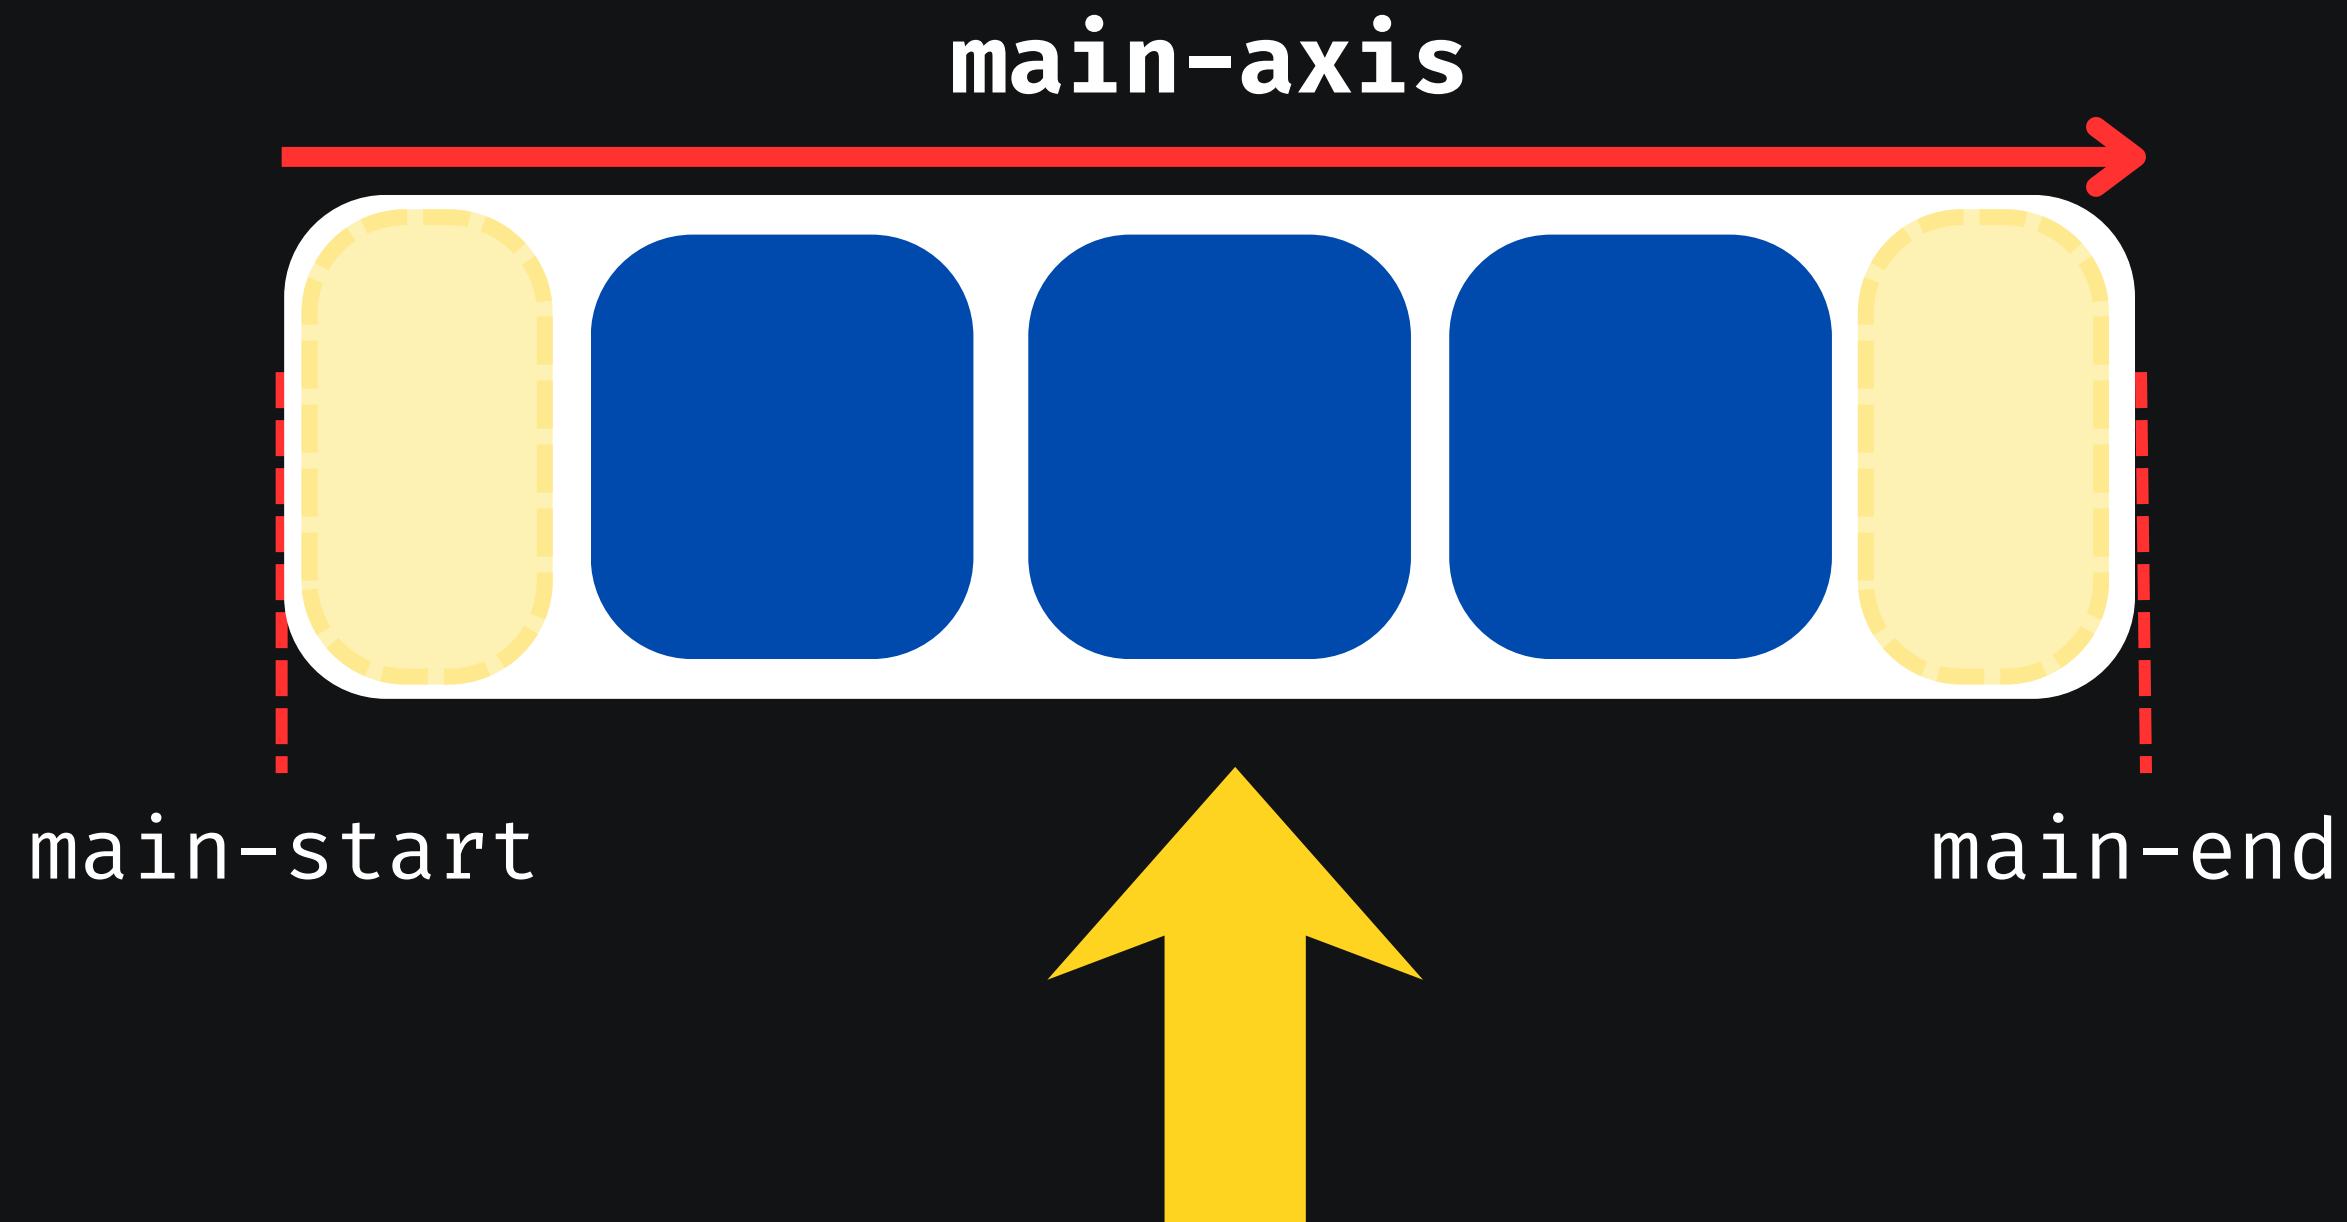

Posiciona os itens no main-start

● justify-content: flex-end

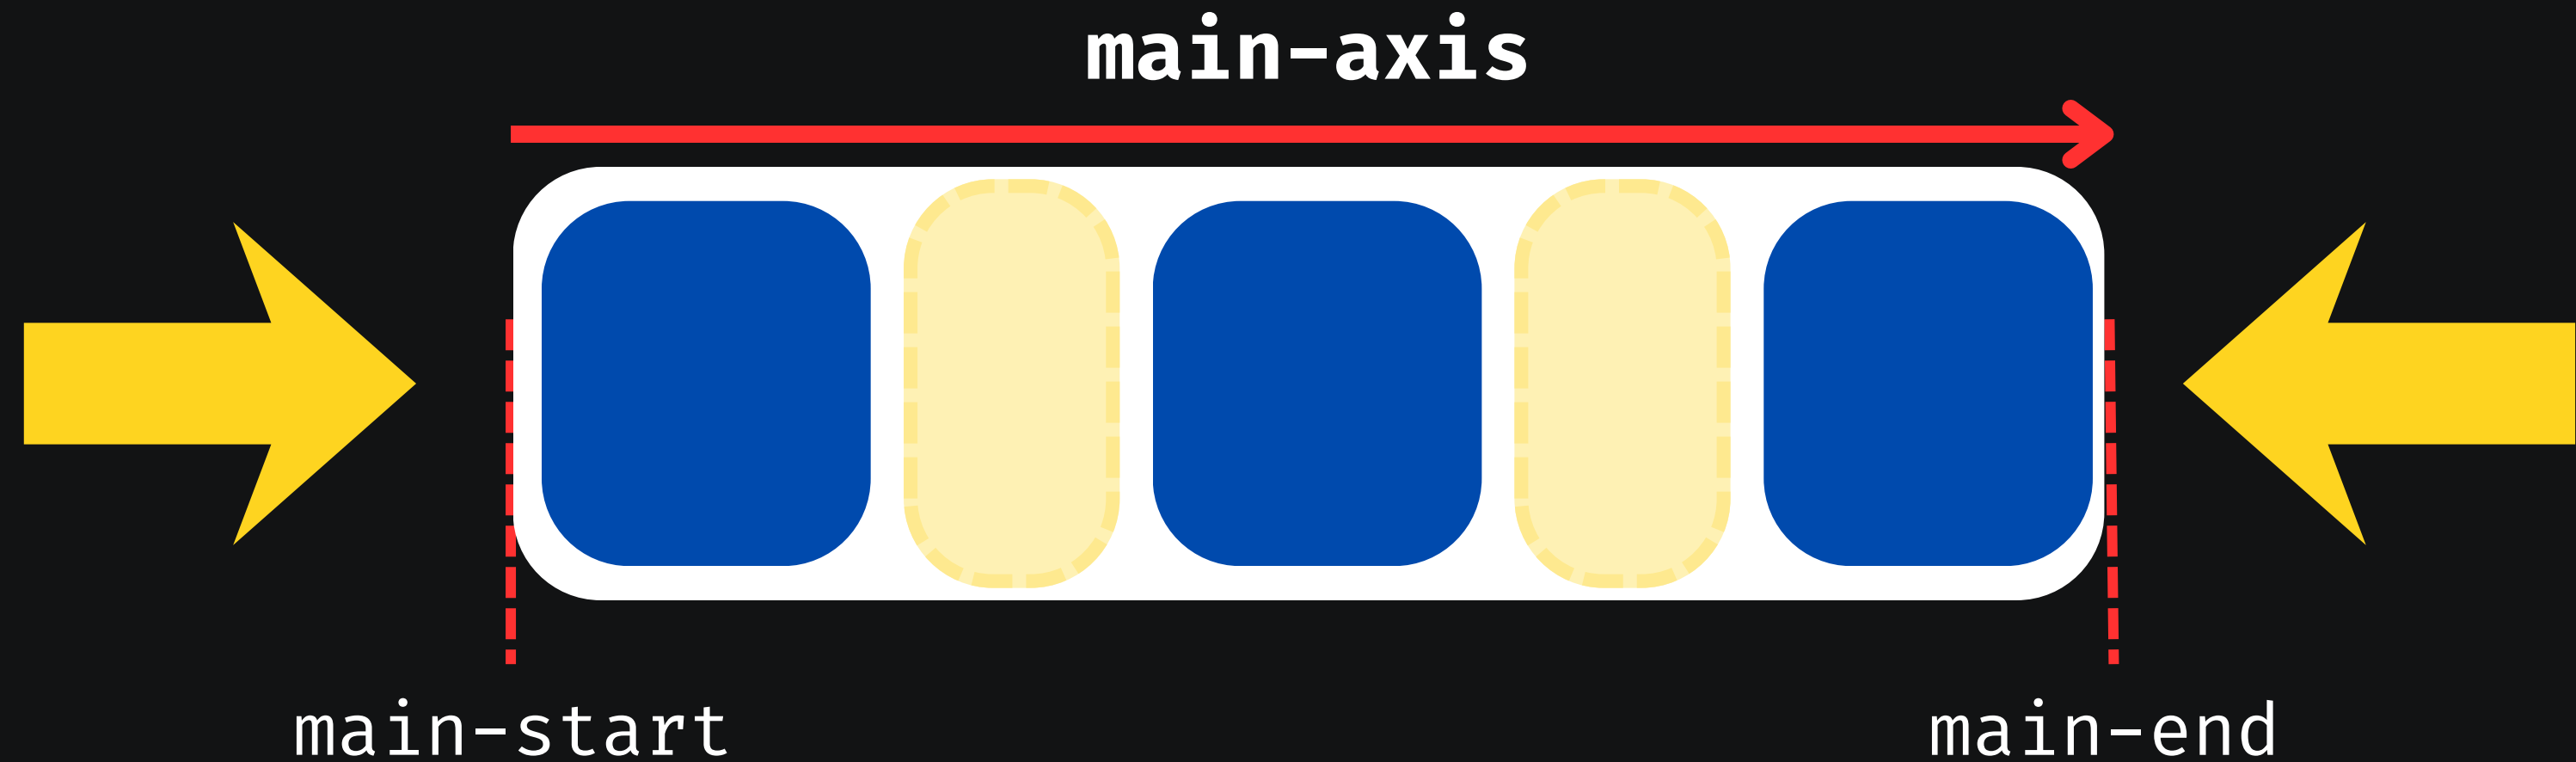

Posiciona os itens no main-end

● justify-content: center

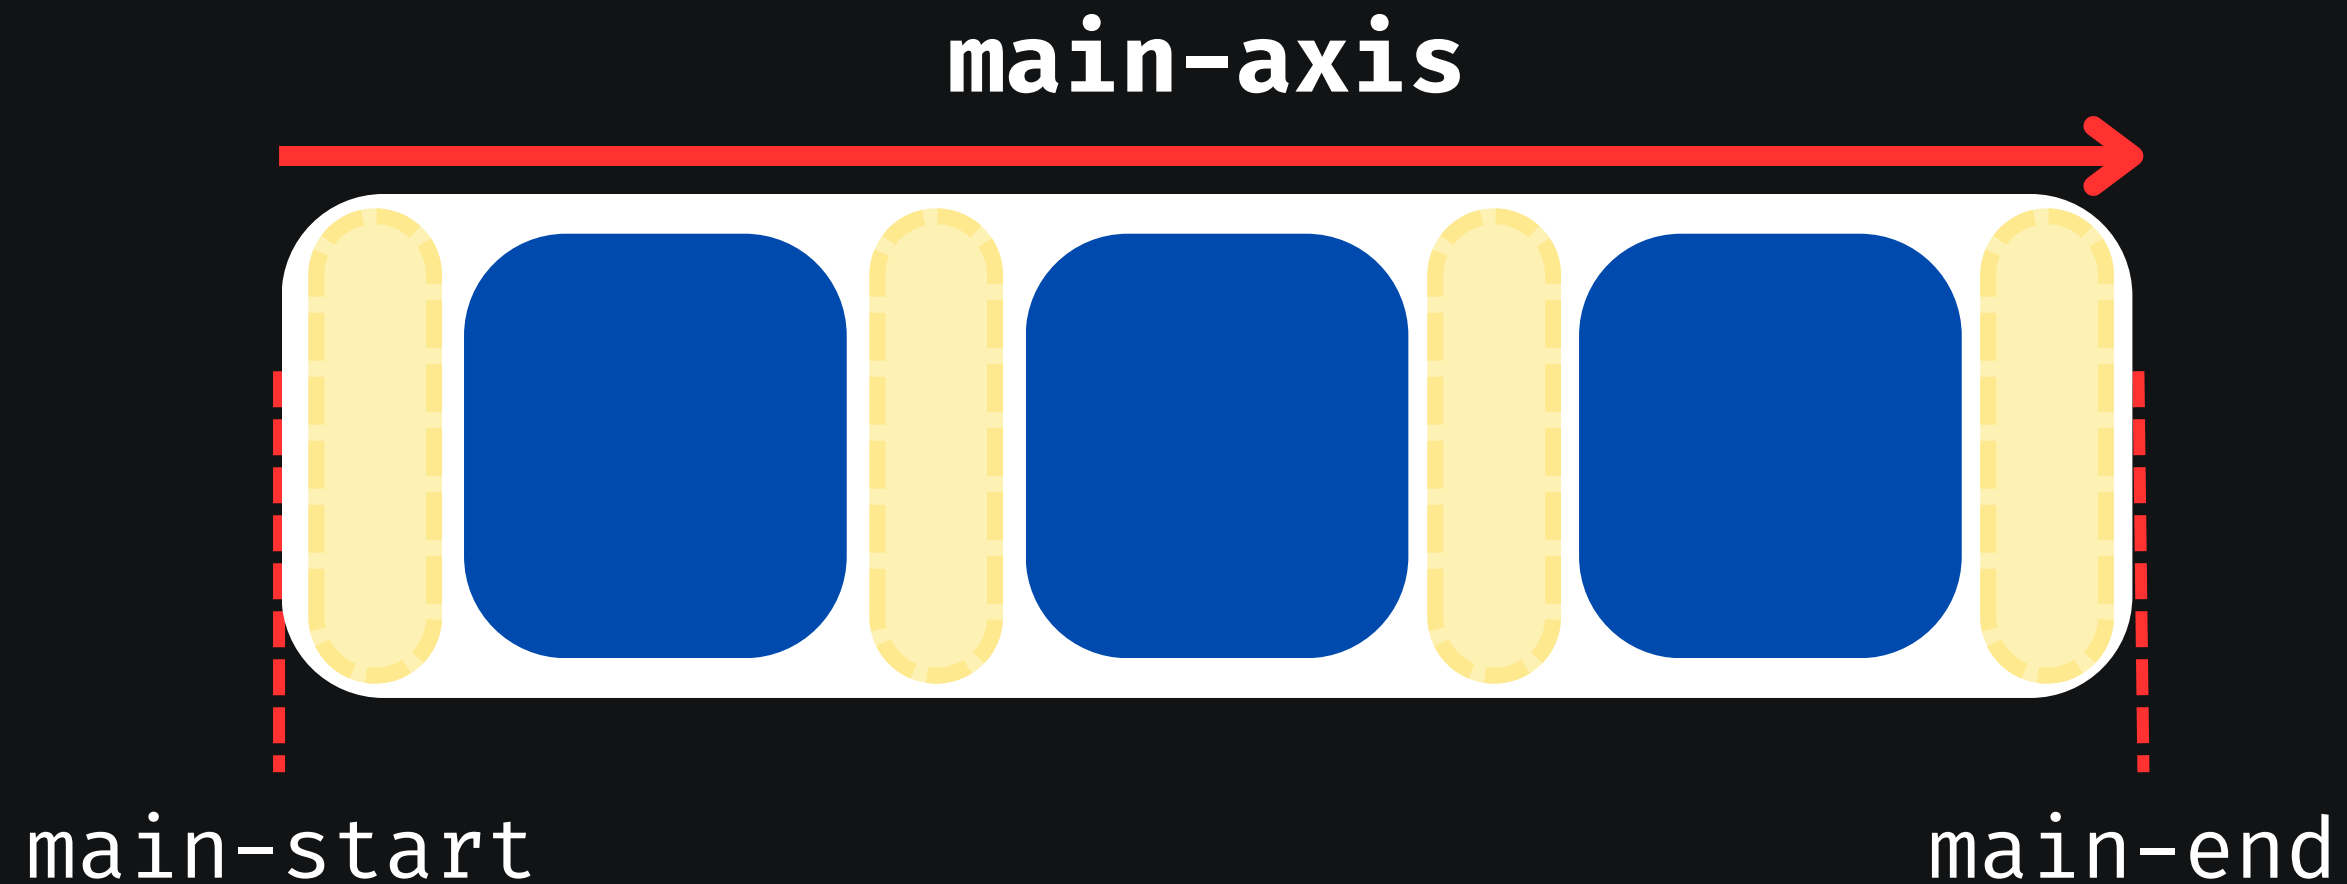

Centraliza os itens no main-axis

● justify-content: space-between

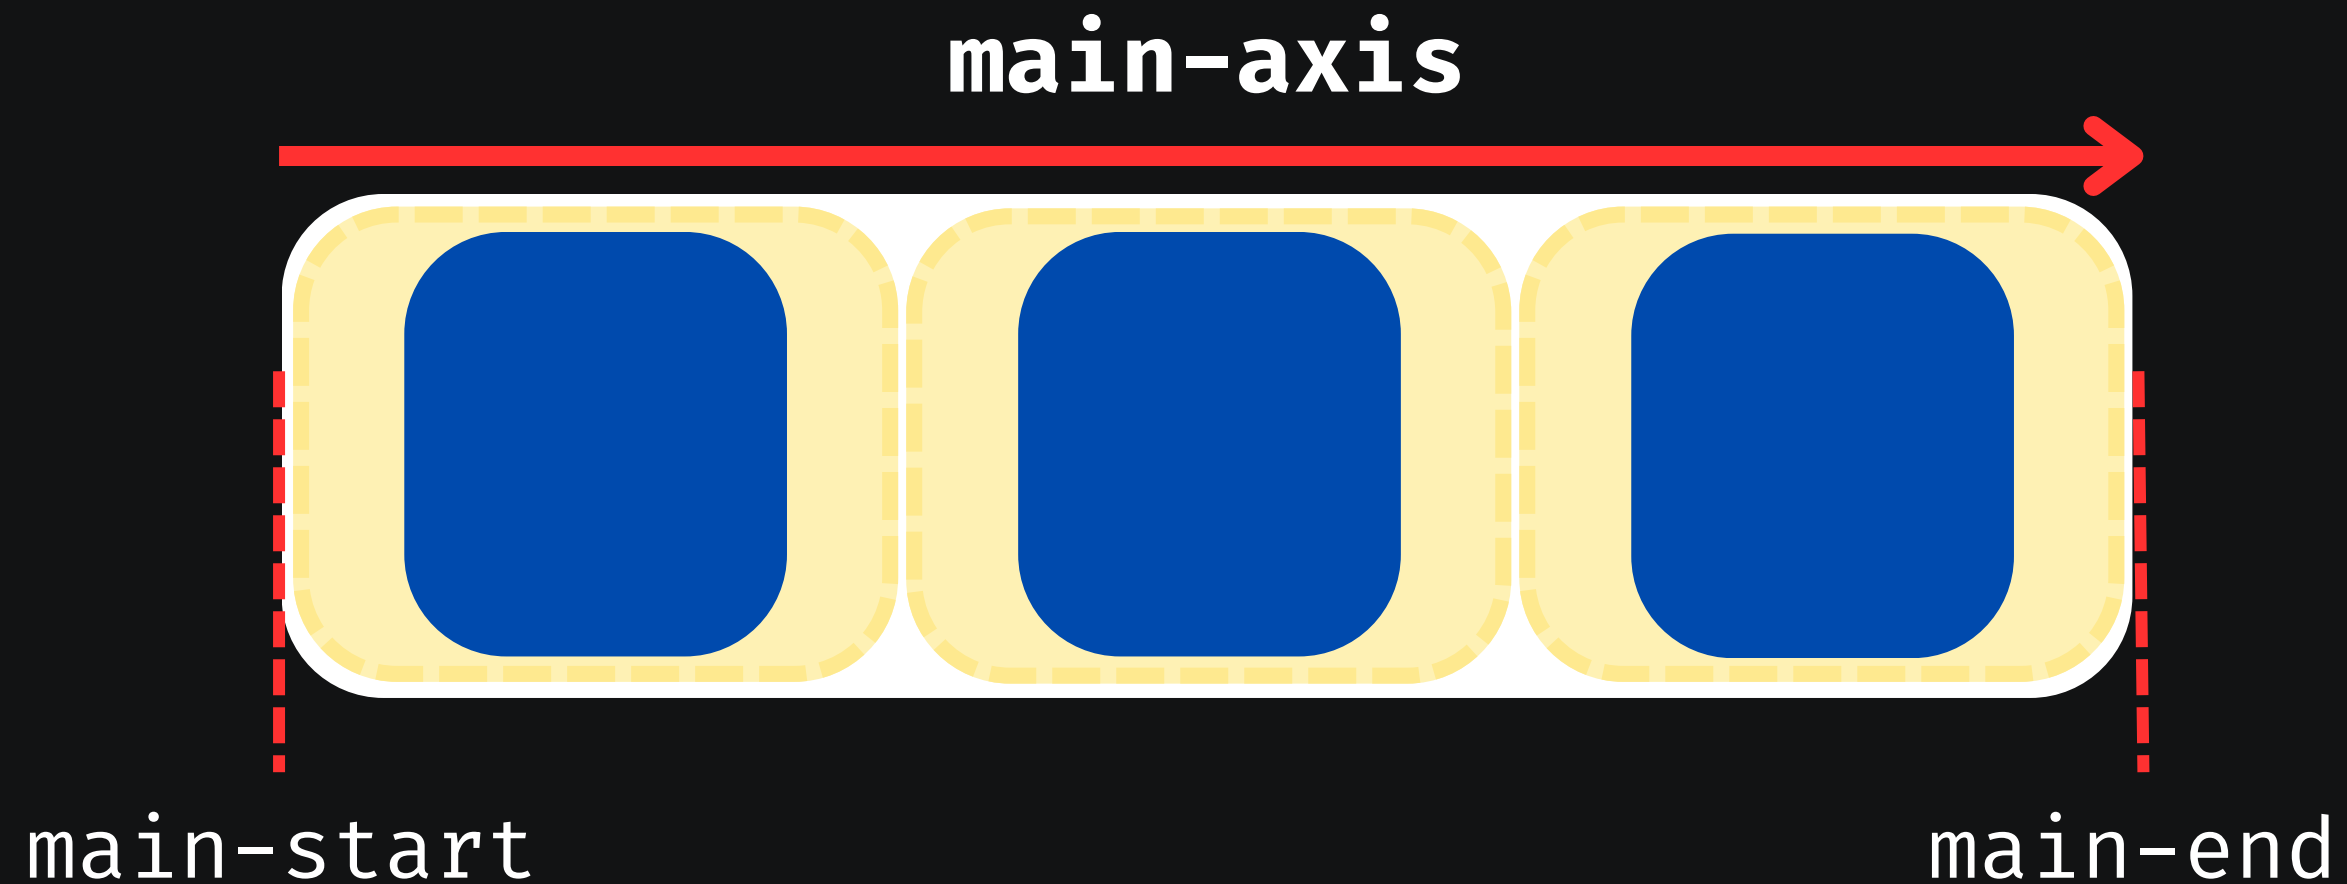

Posiciona o primeiro e último
item nas pontas

● justify-content: space-evenly

Deixa o mesmo espaço entre todos os itens e as pontas

● justify-content: space-around

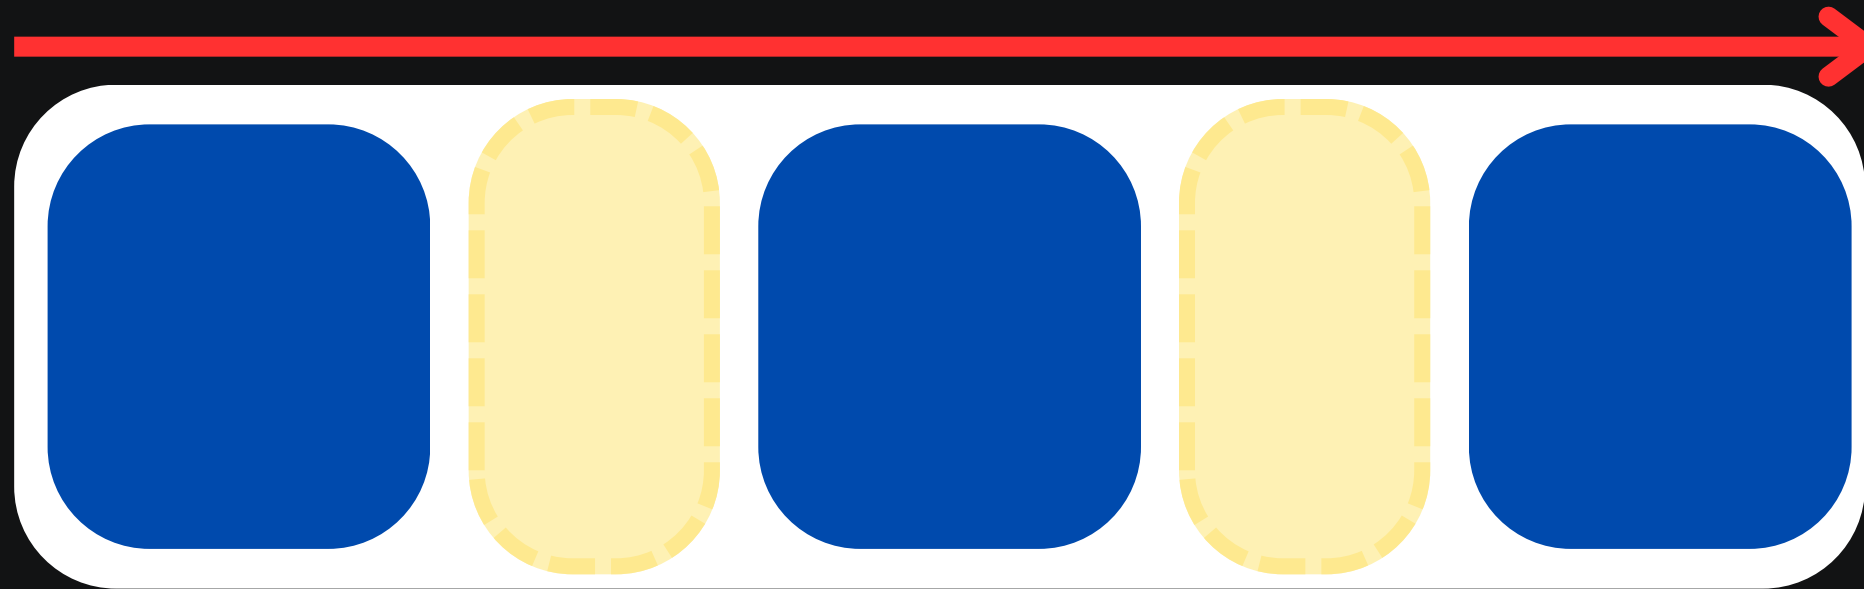

**Divide o container em áreas iguais
e centraliza os itens dentro delas**

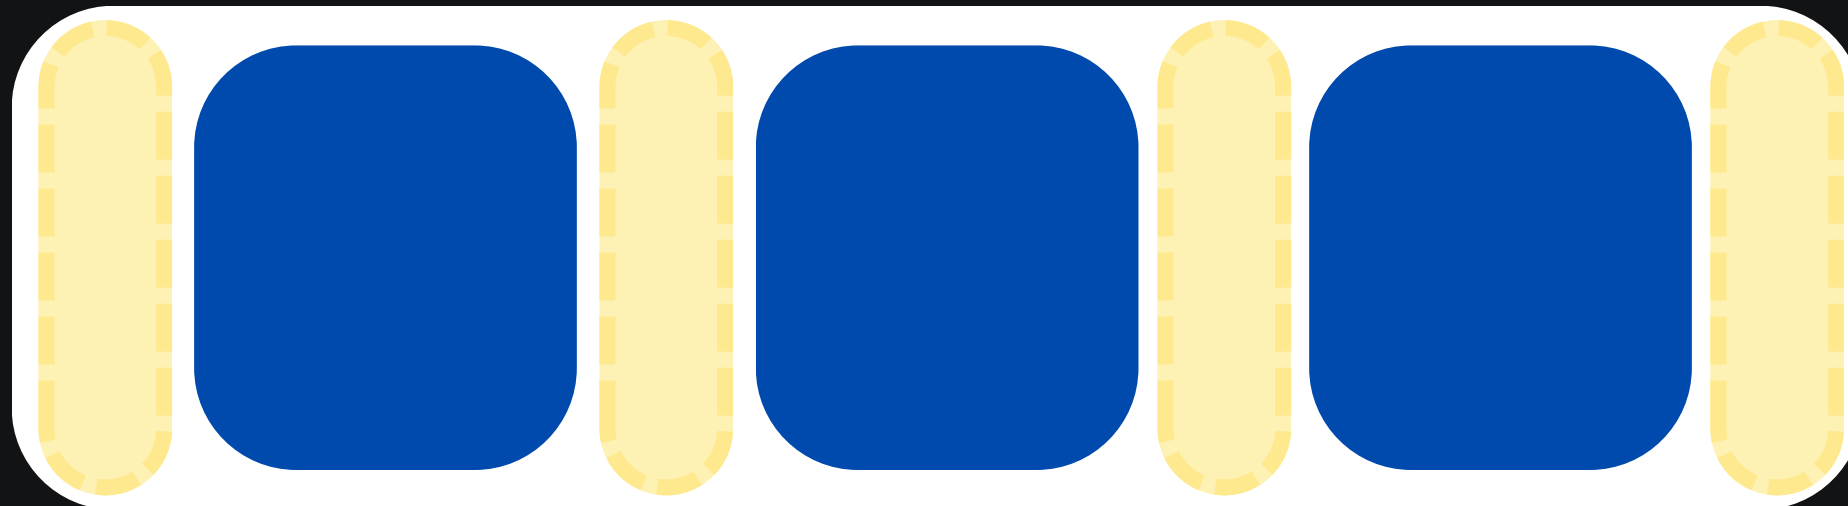

● justify-content

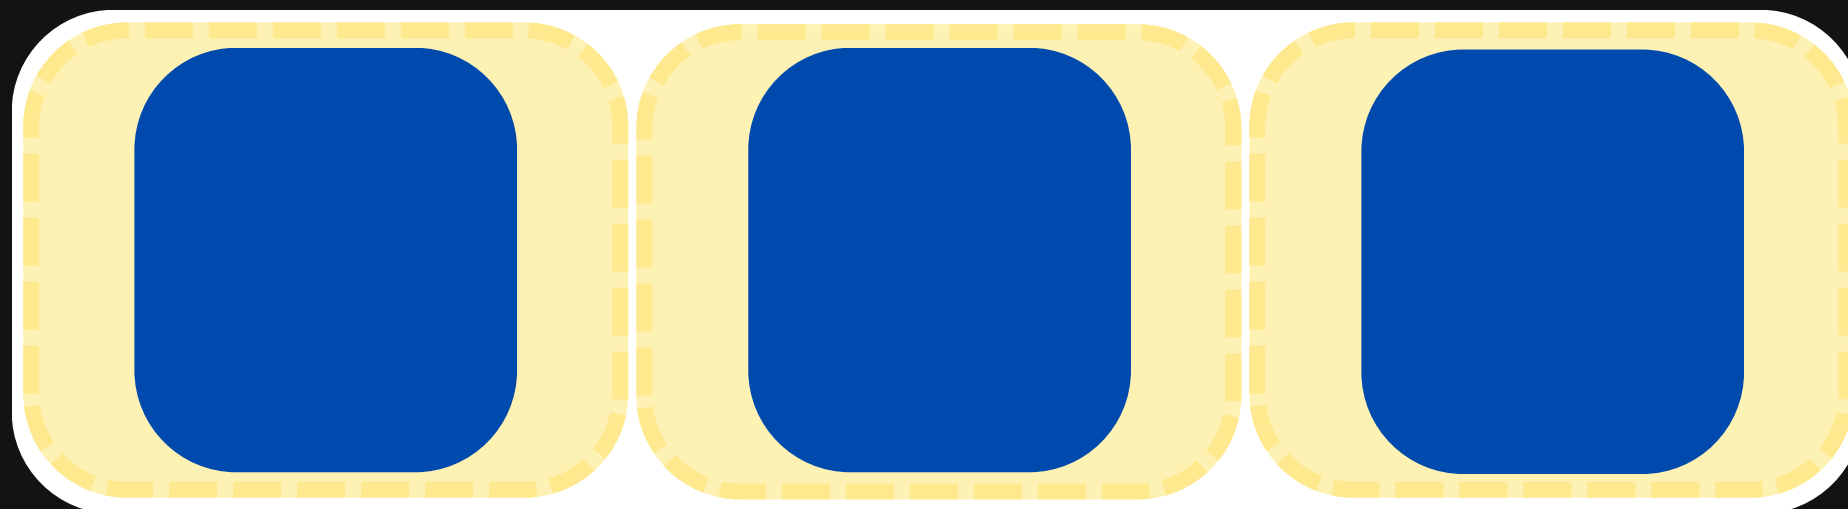

main-axis

space-between

space-evenly

space-around

● justify-content

flex-flow: column nowrap;

main-axis

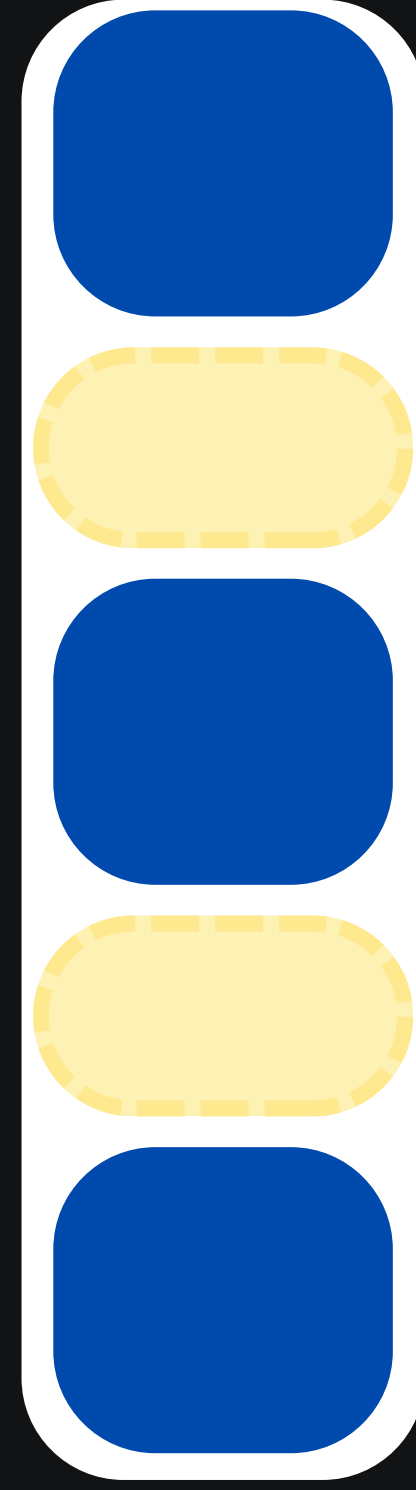

flex-start

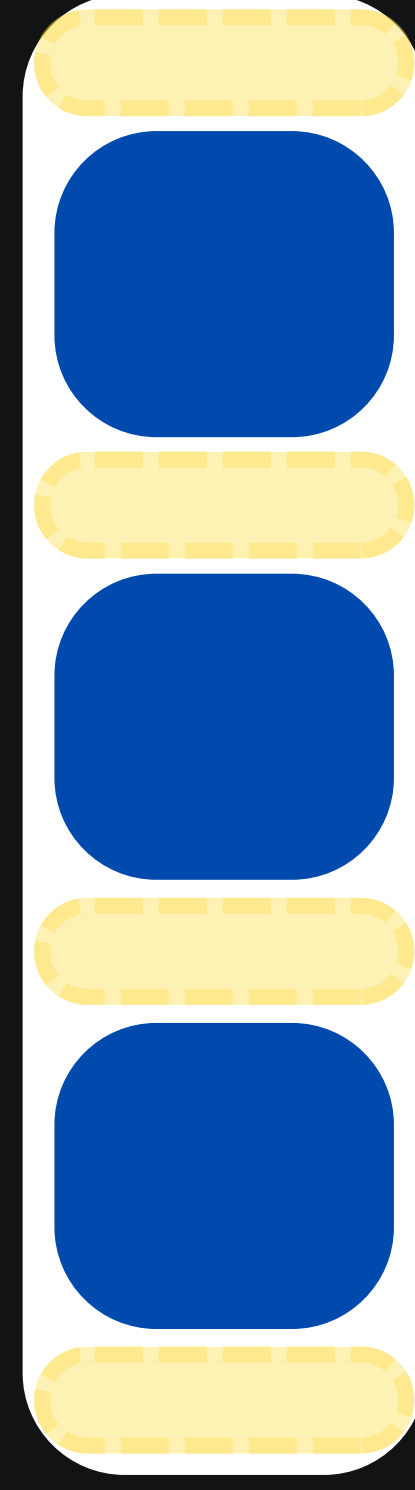

flex-end

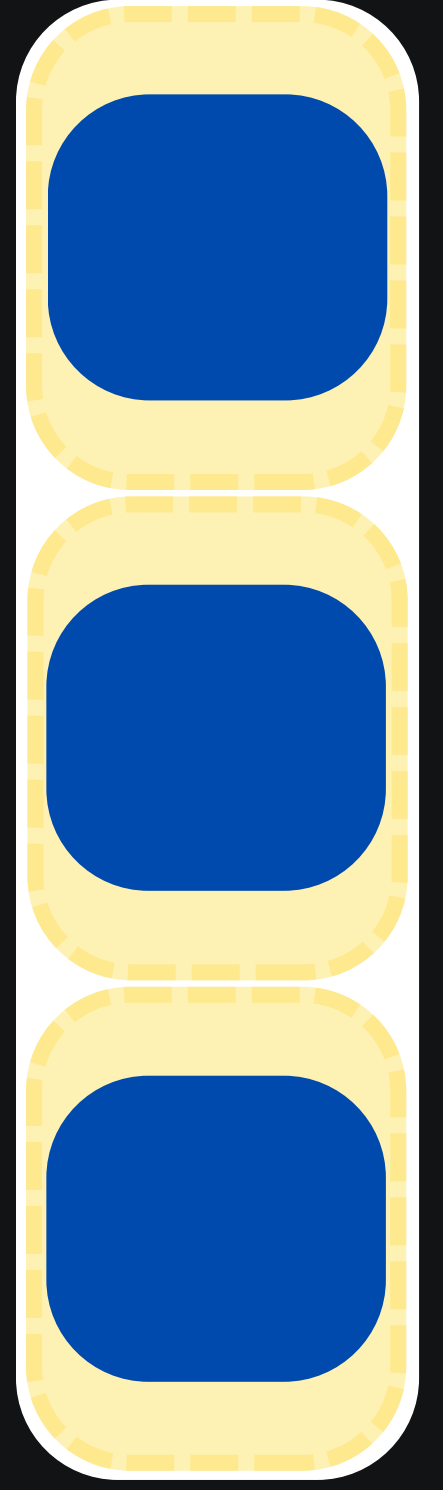

center

space-between

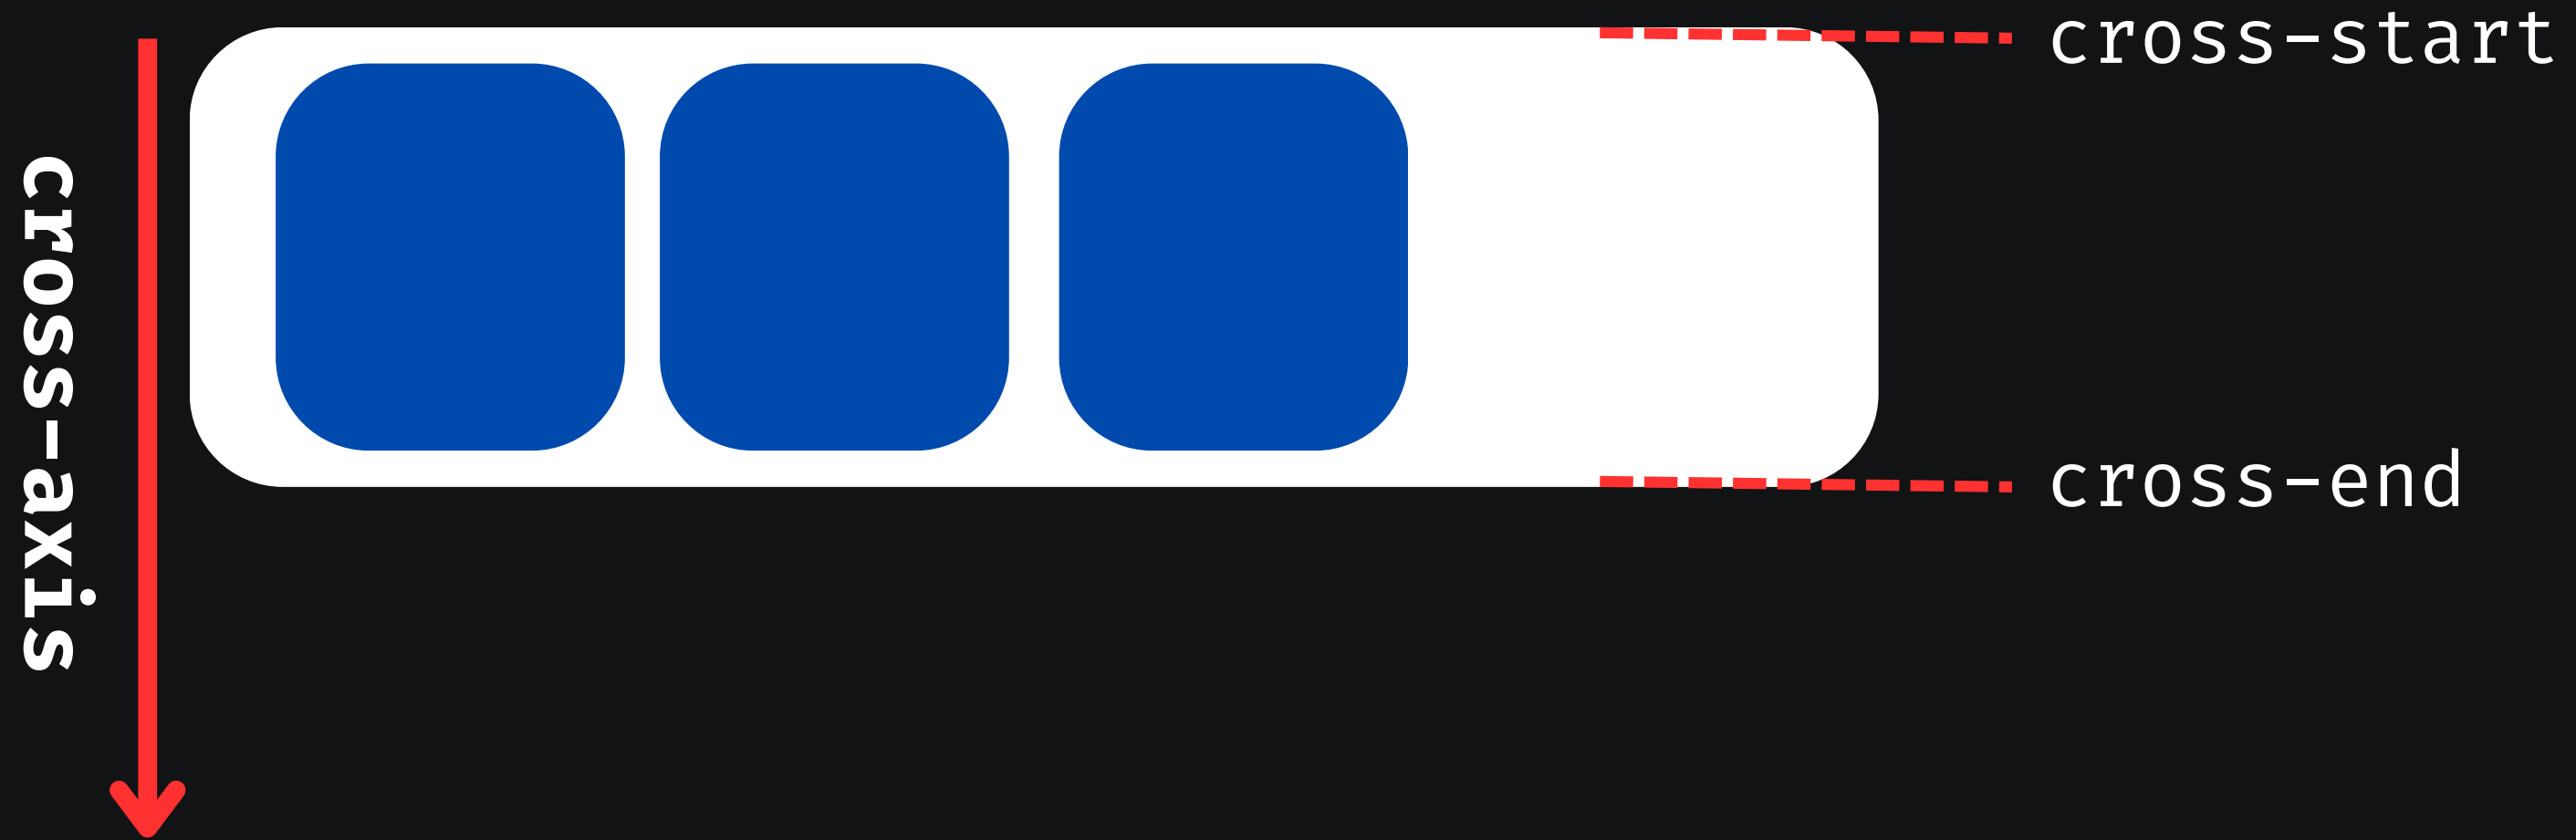

space-evenly

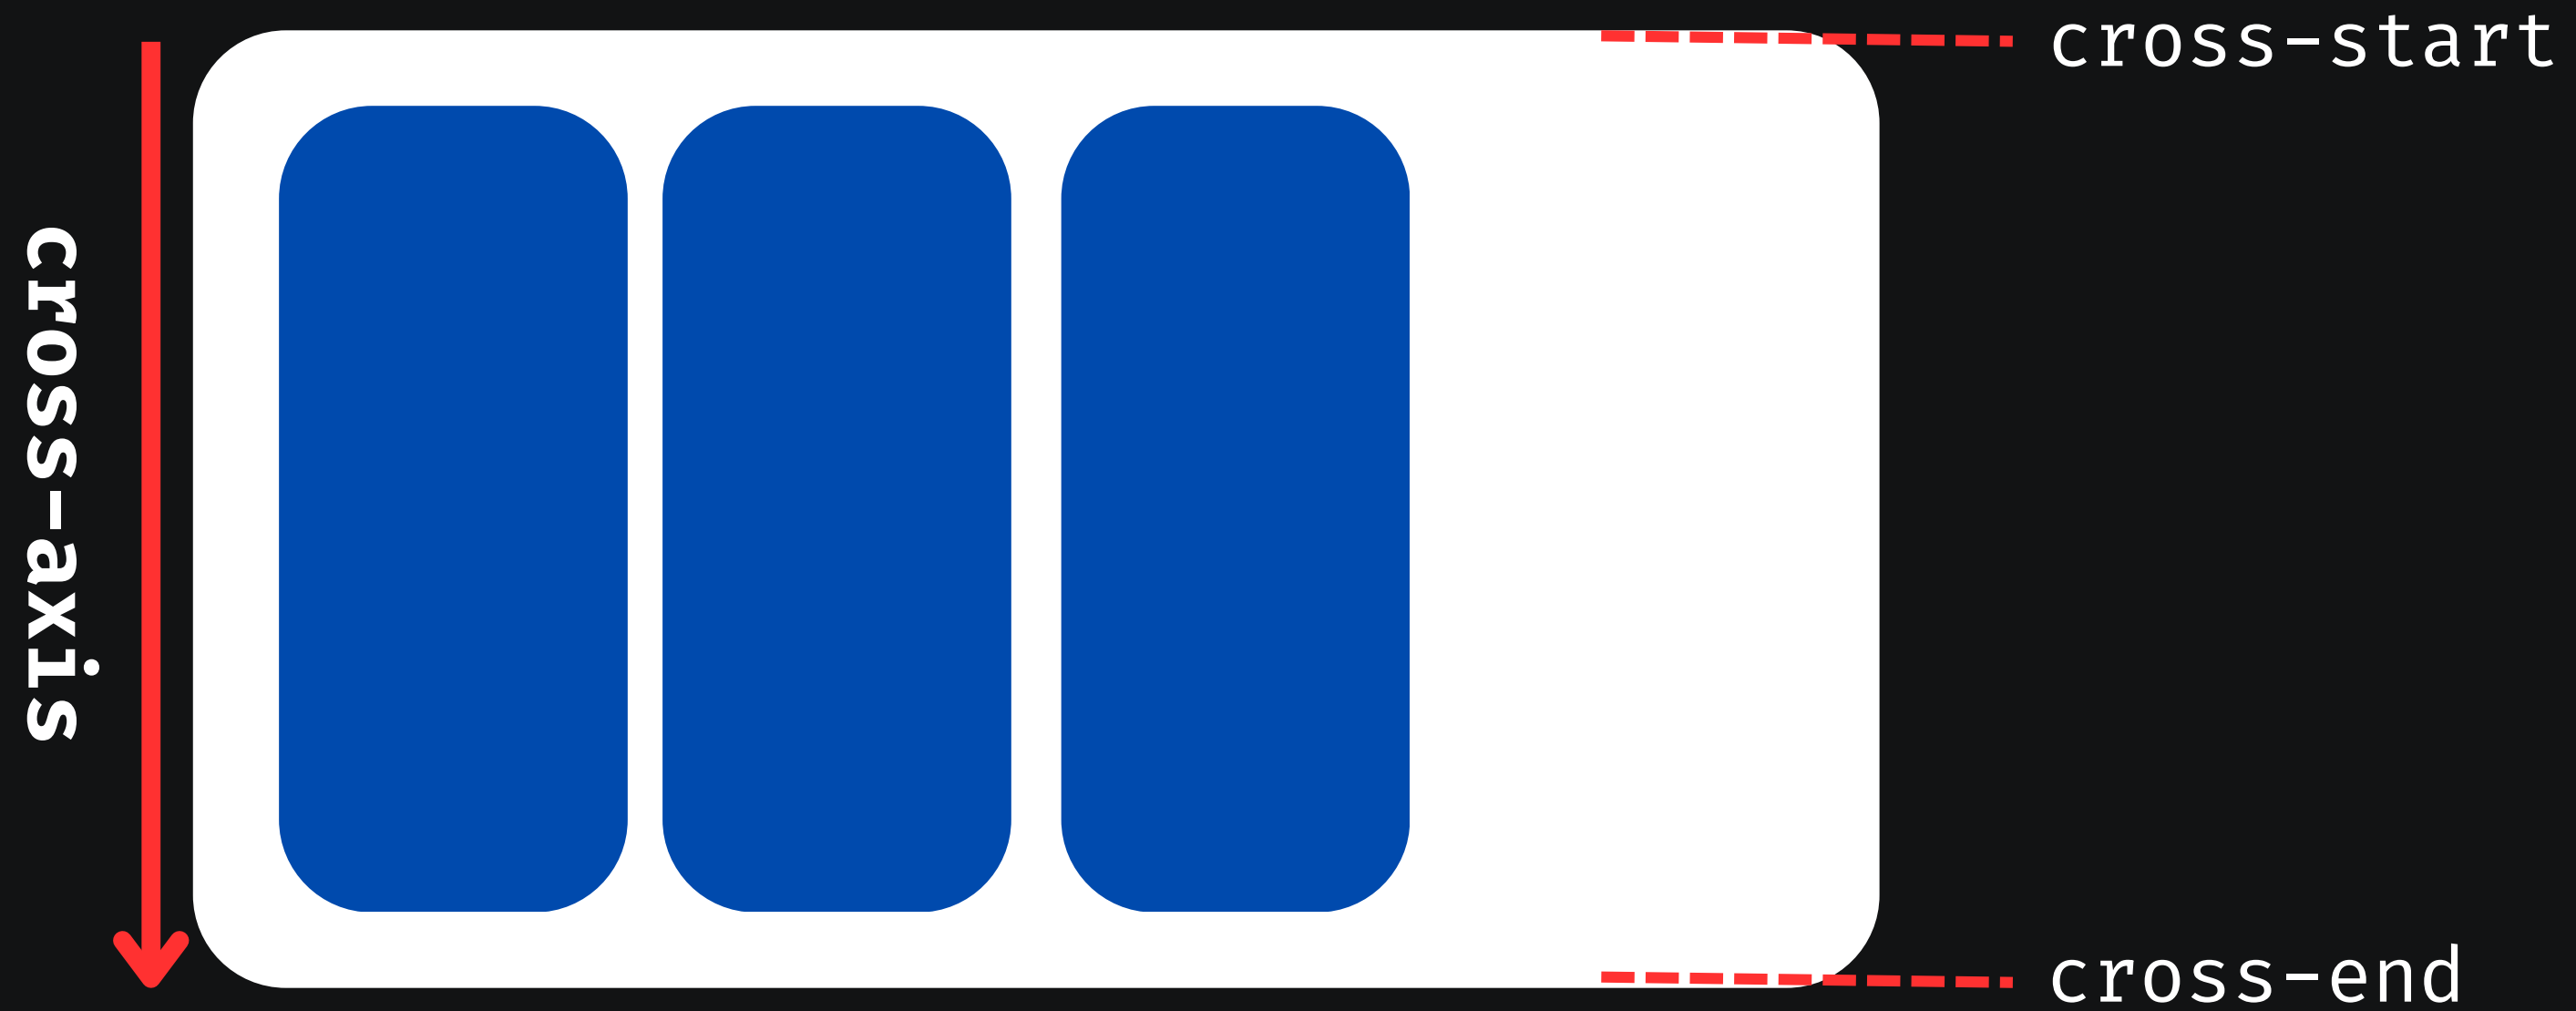

space-around

● align-items:

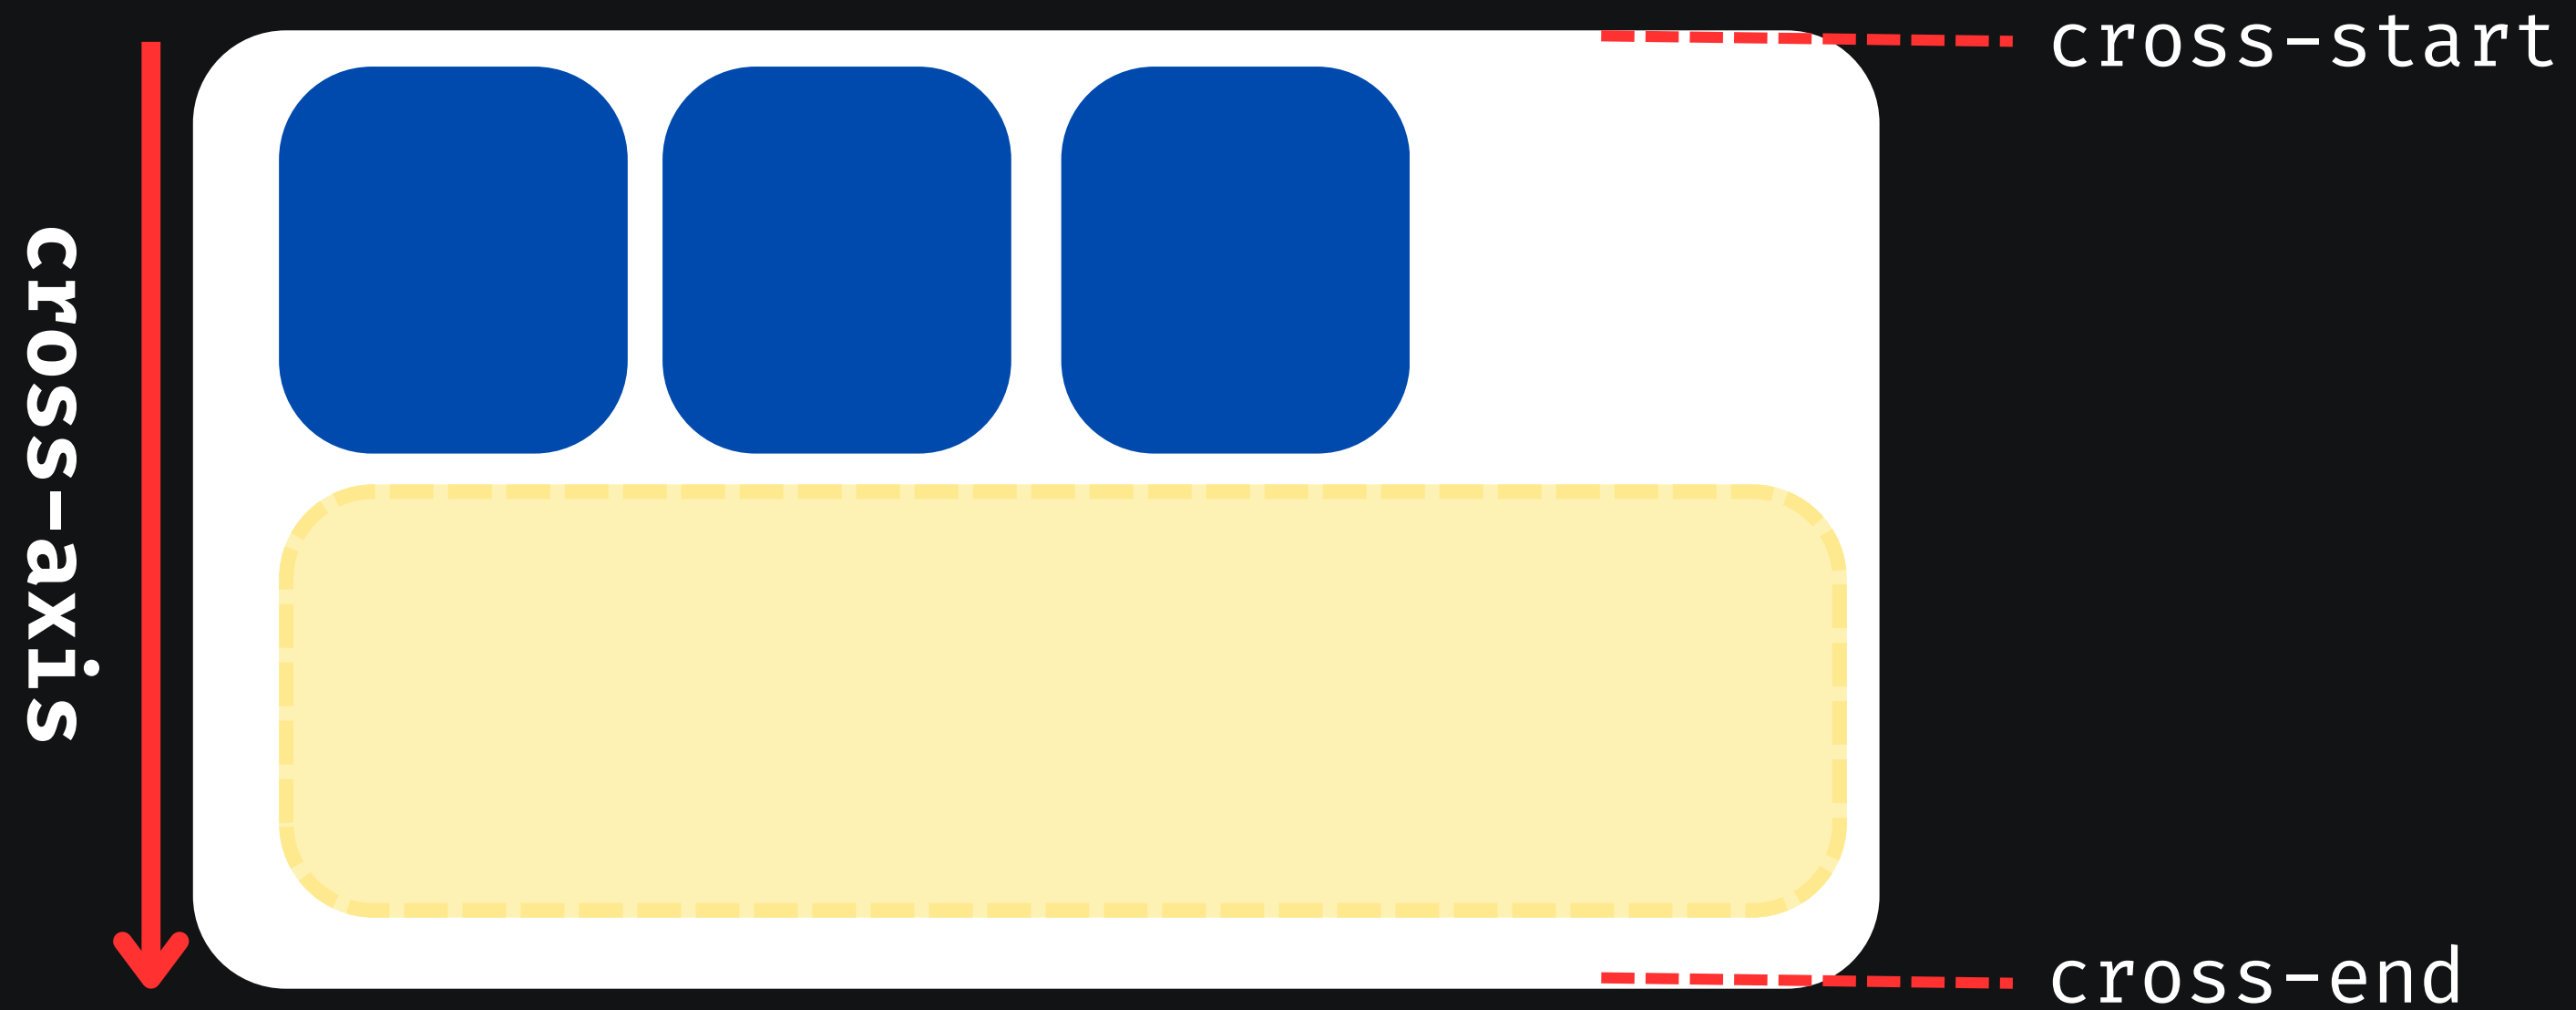

Posicionar os itens com relação ao **cross-axis**

● align-items: stretch

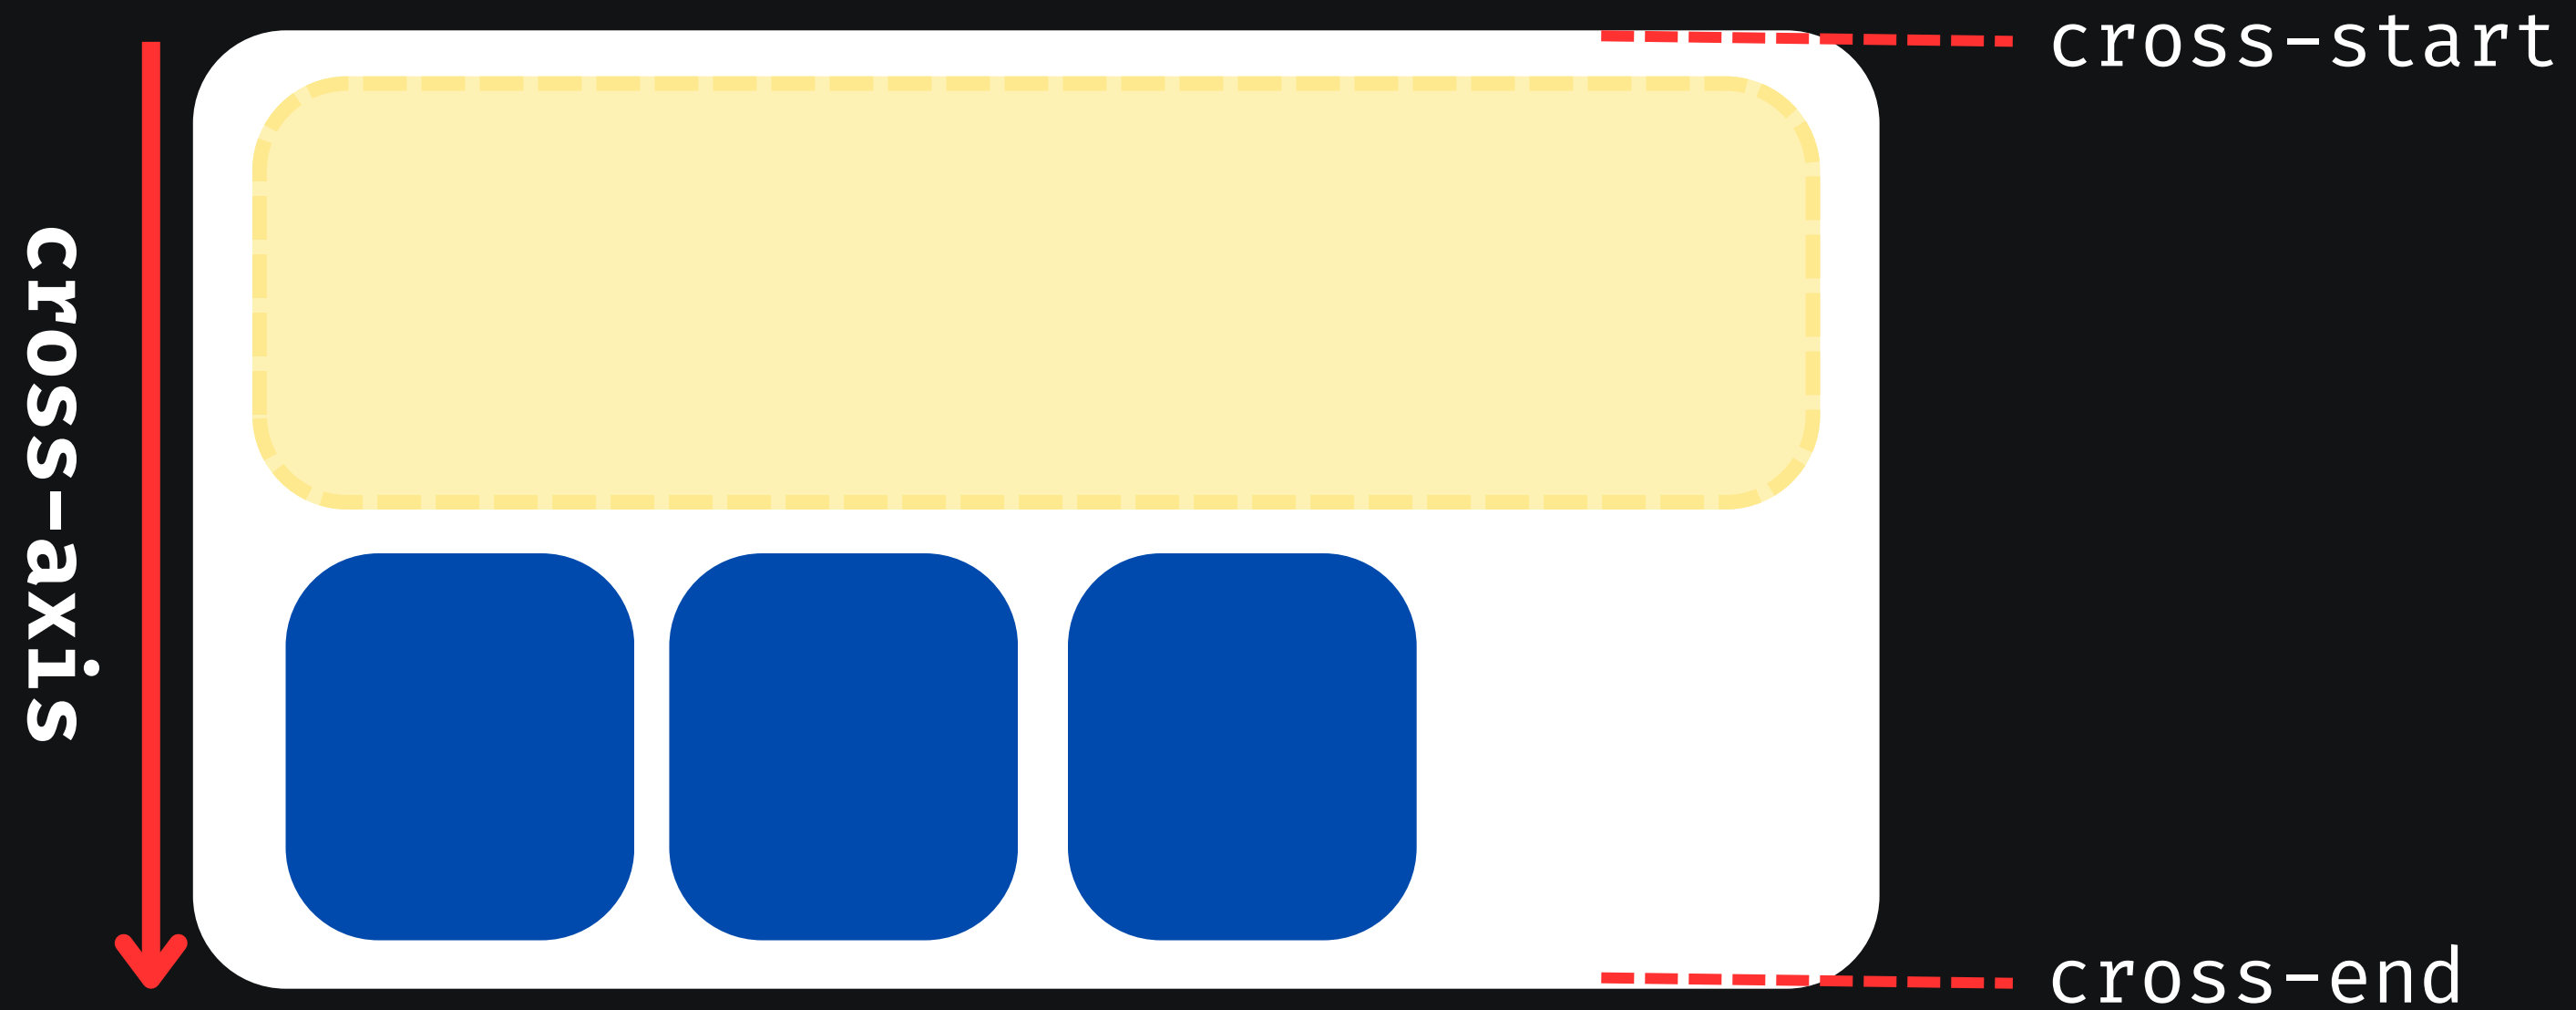

Estica os itens junto do cross-axis

● align-items: flex-start

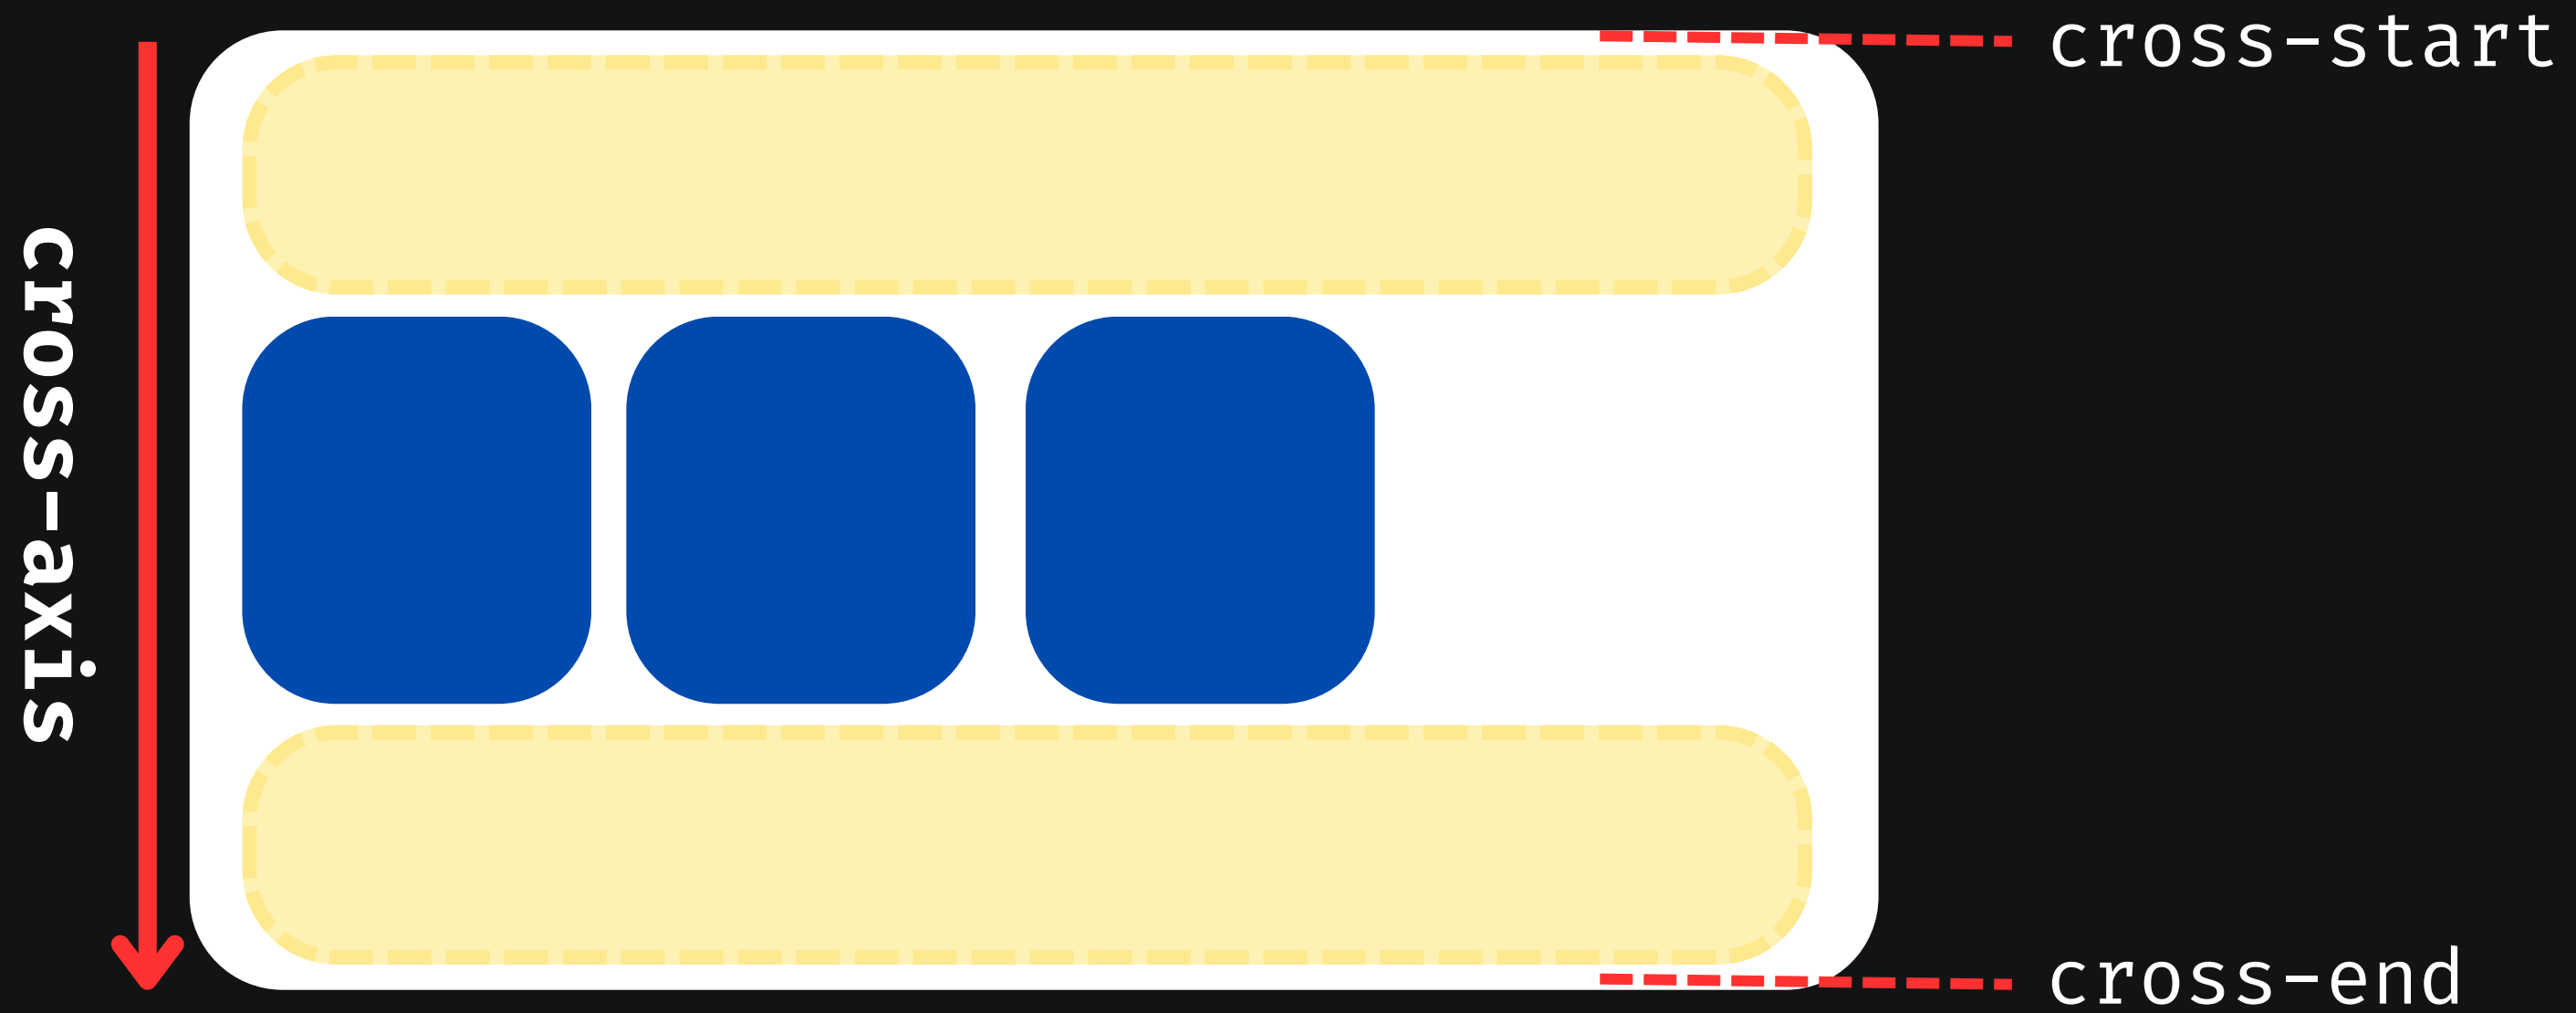

Posiciona os itens no **cross-start**

● align-items: flex-end

Posiciona os itens no **cross-end**

● align-items: center

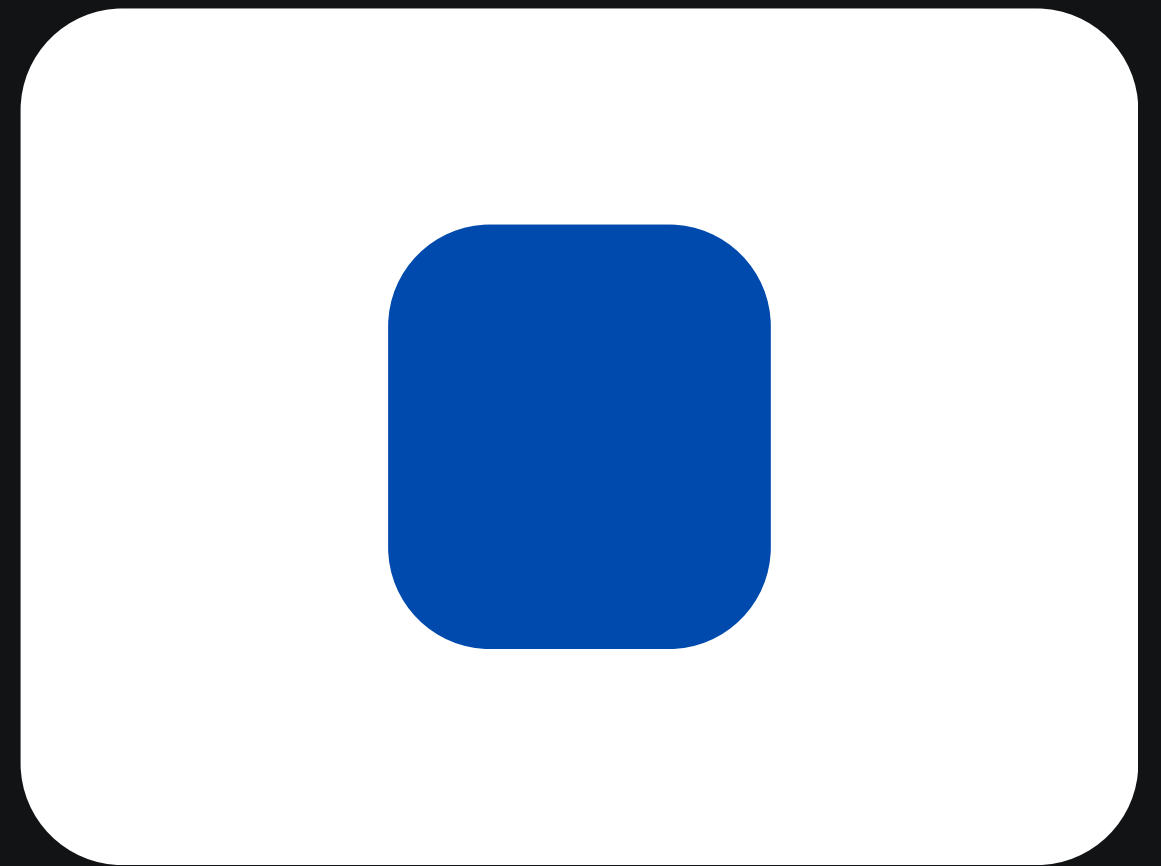

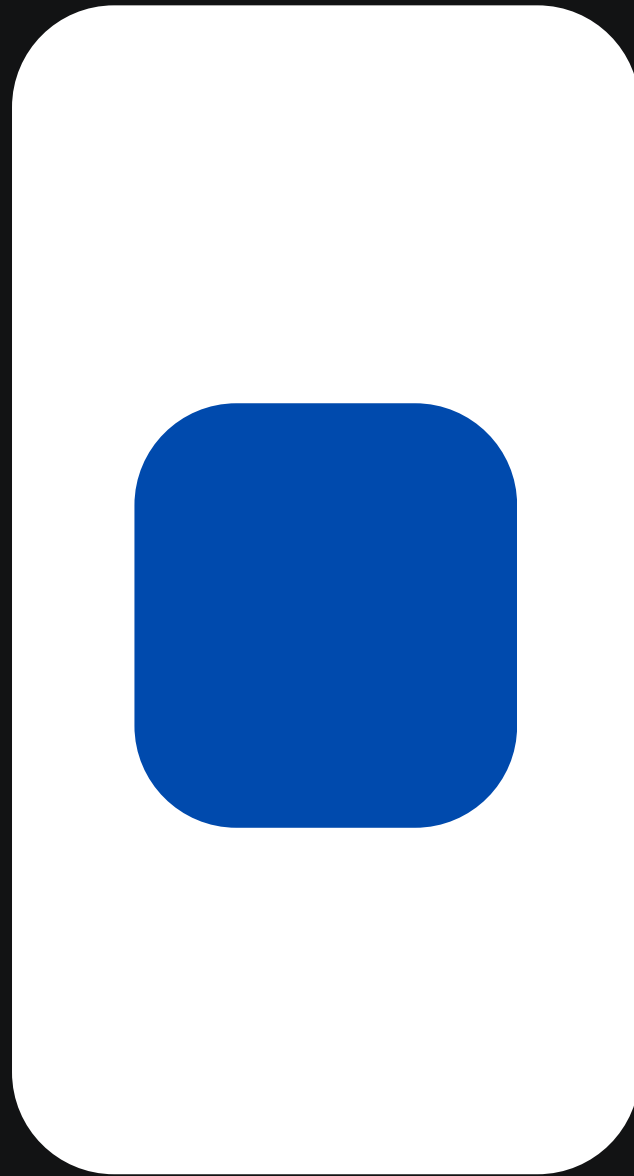

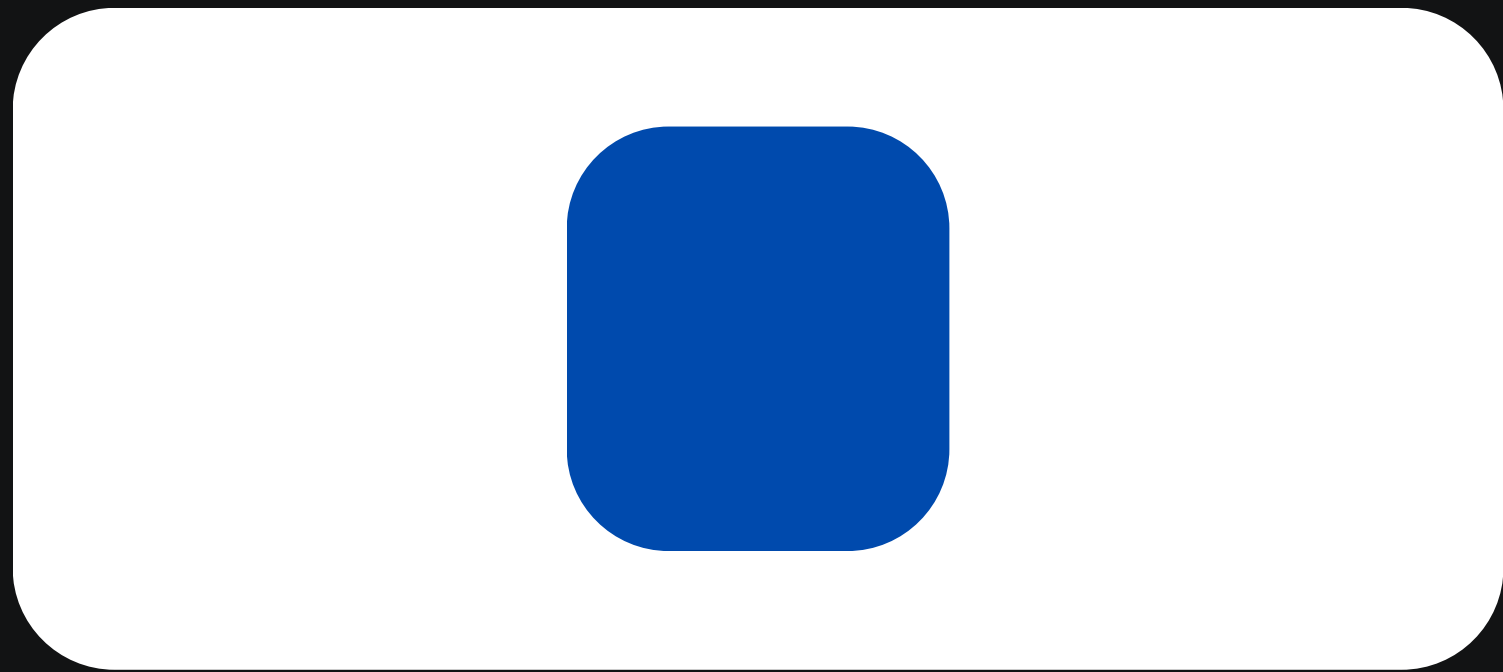

Centraliza os itens no **cross-axis**

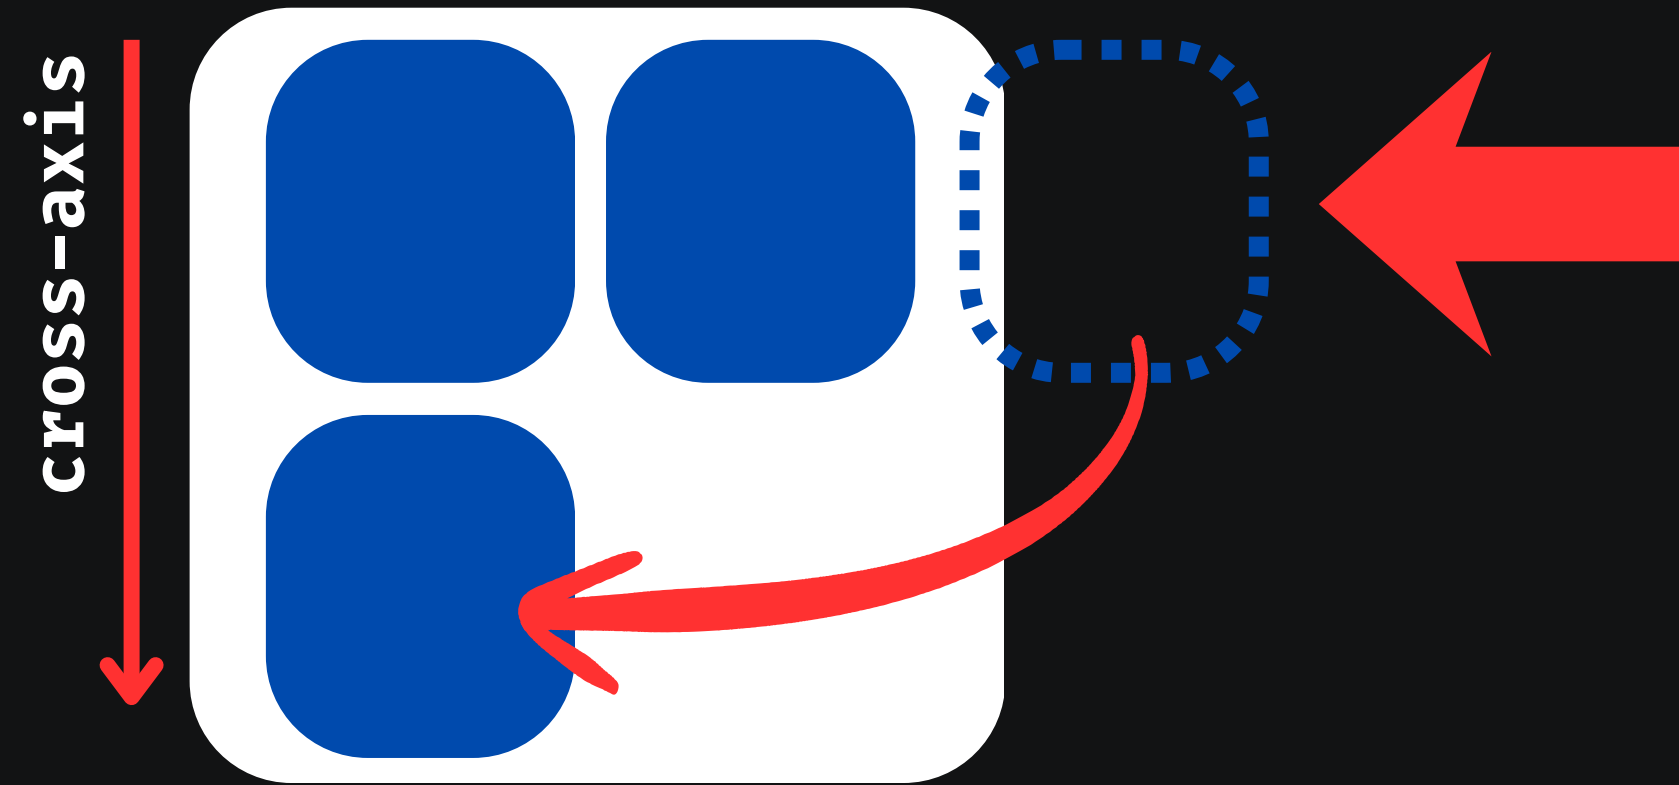

● Centralizando itens

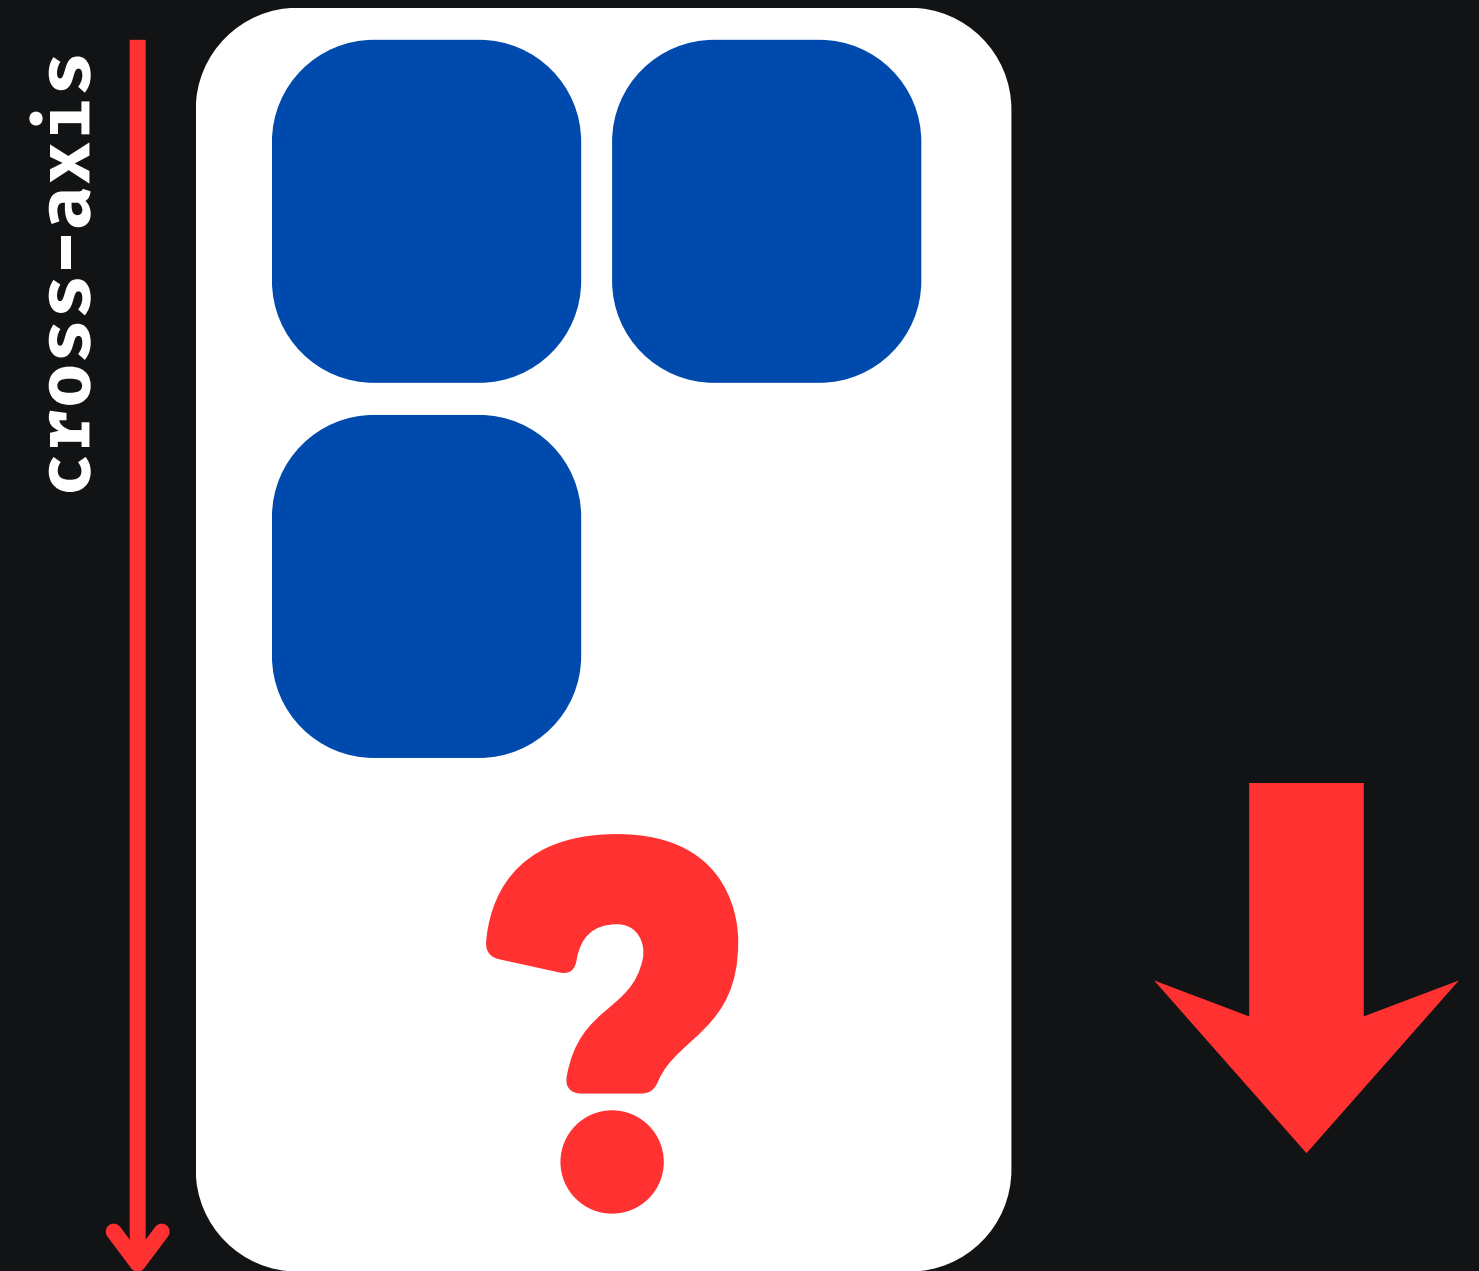

```
justify-content: center;  
align-items: center;
```

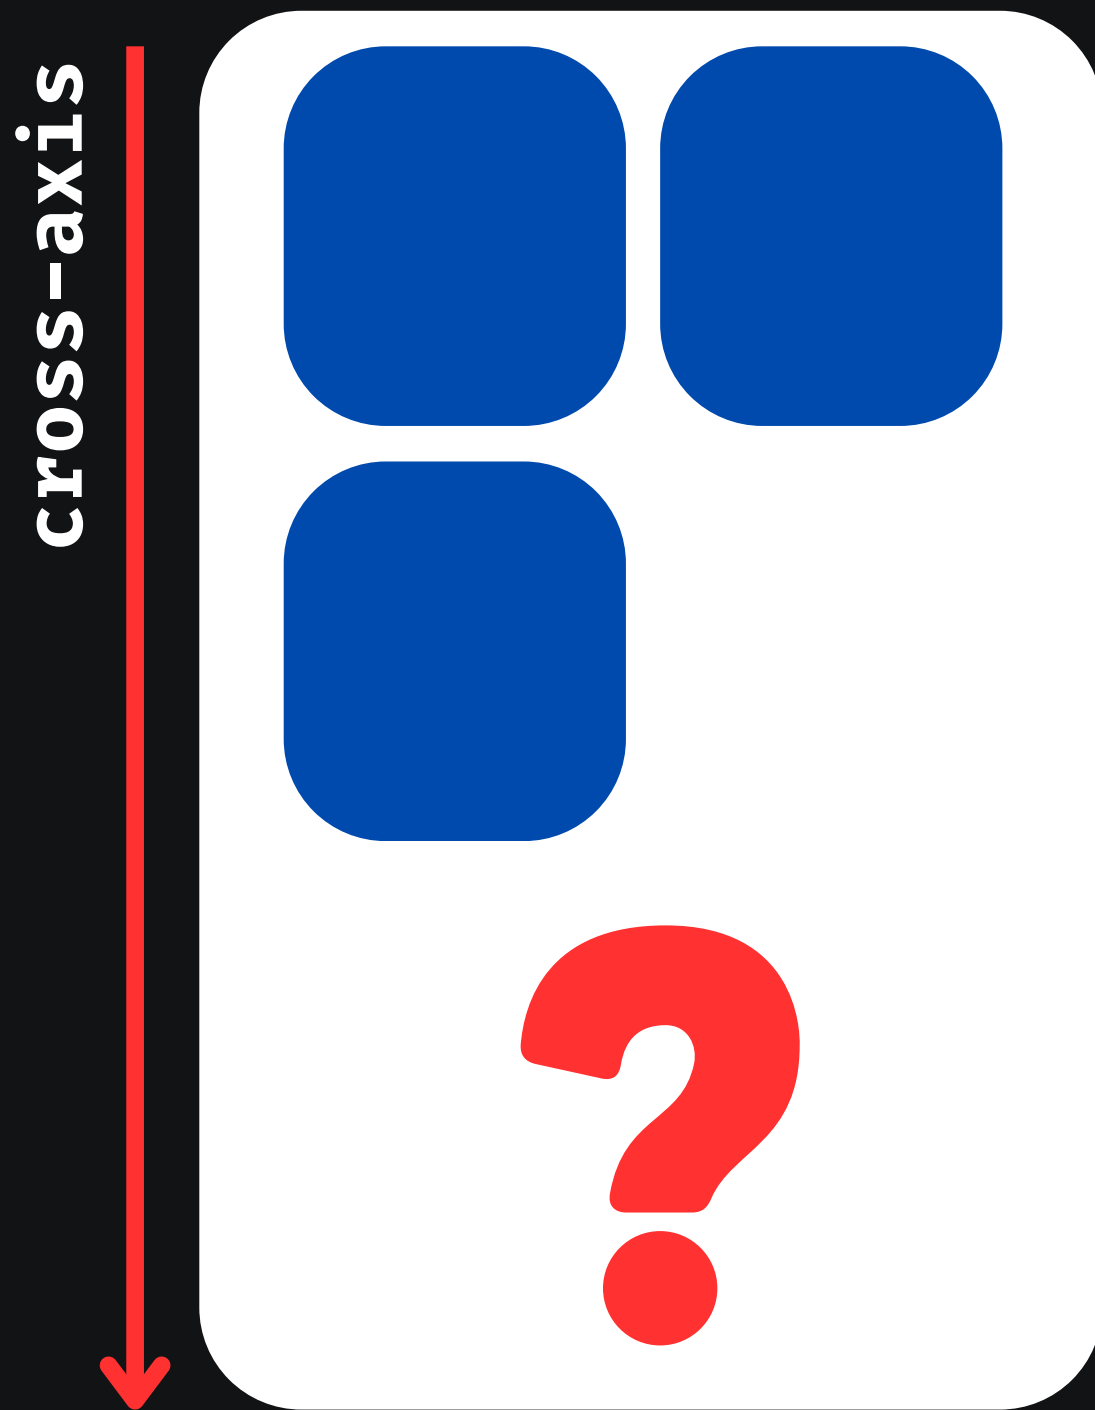

● Conteúdo empacotado

O que acontece se o
wrap esta ativado e
cross-axis aumenta?

● align-content

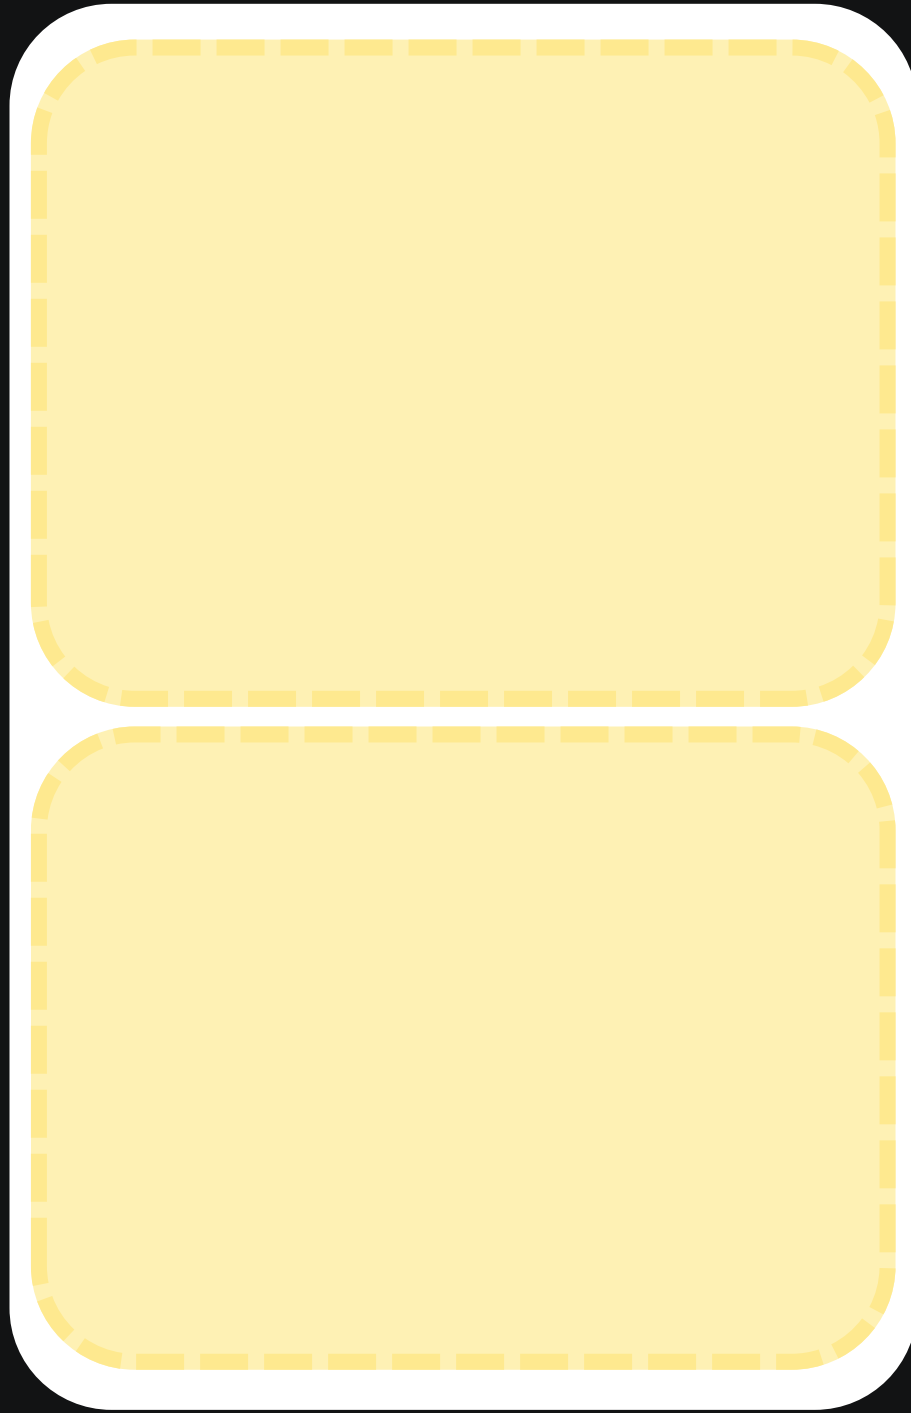

O **align-content** serve para organizar os itens com relação ao cross-axis quando eles estão empacotados (wrap). Enquanto que o **justify-content** vai alinhar os itens com relação ao eixo principal (main-axis).

● align-content: stretch

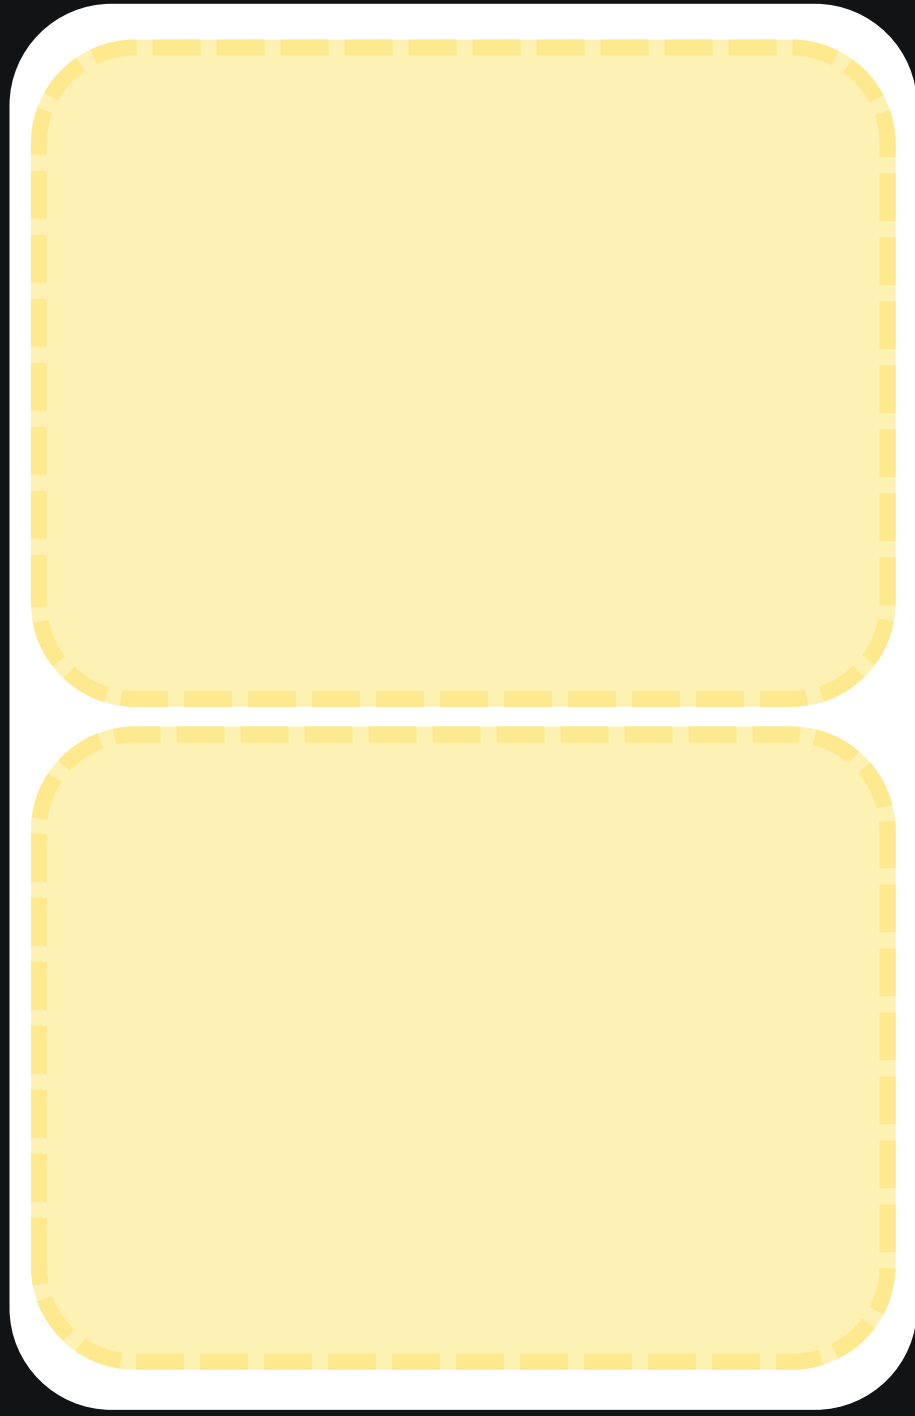

cross-axis

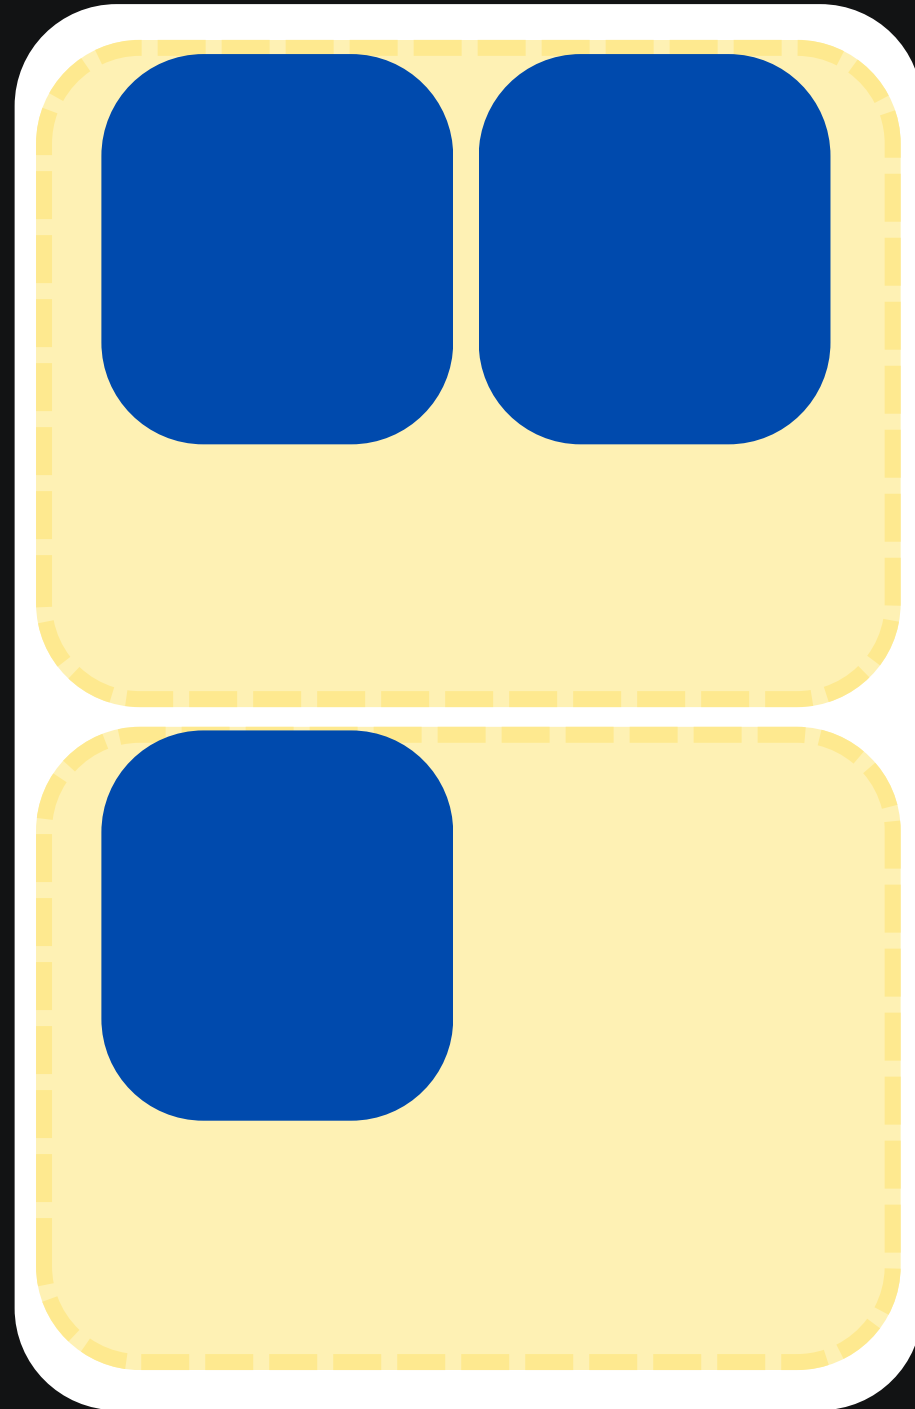

● align-content: stretch

cross-axis

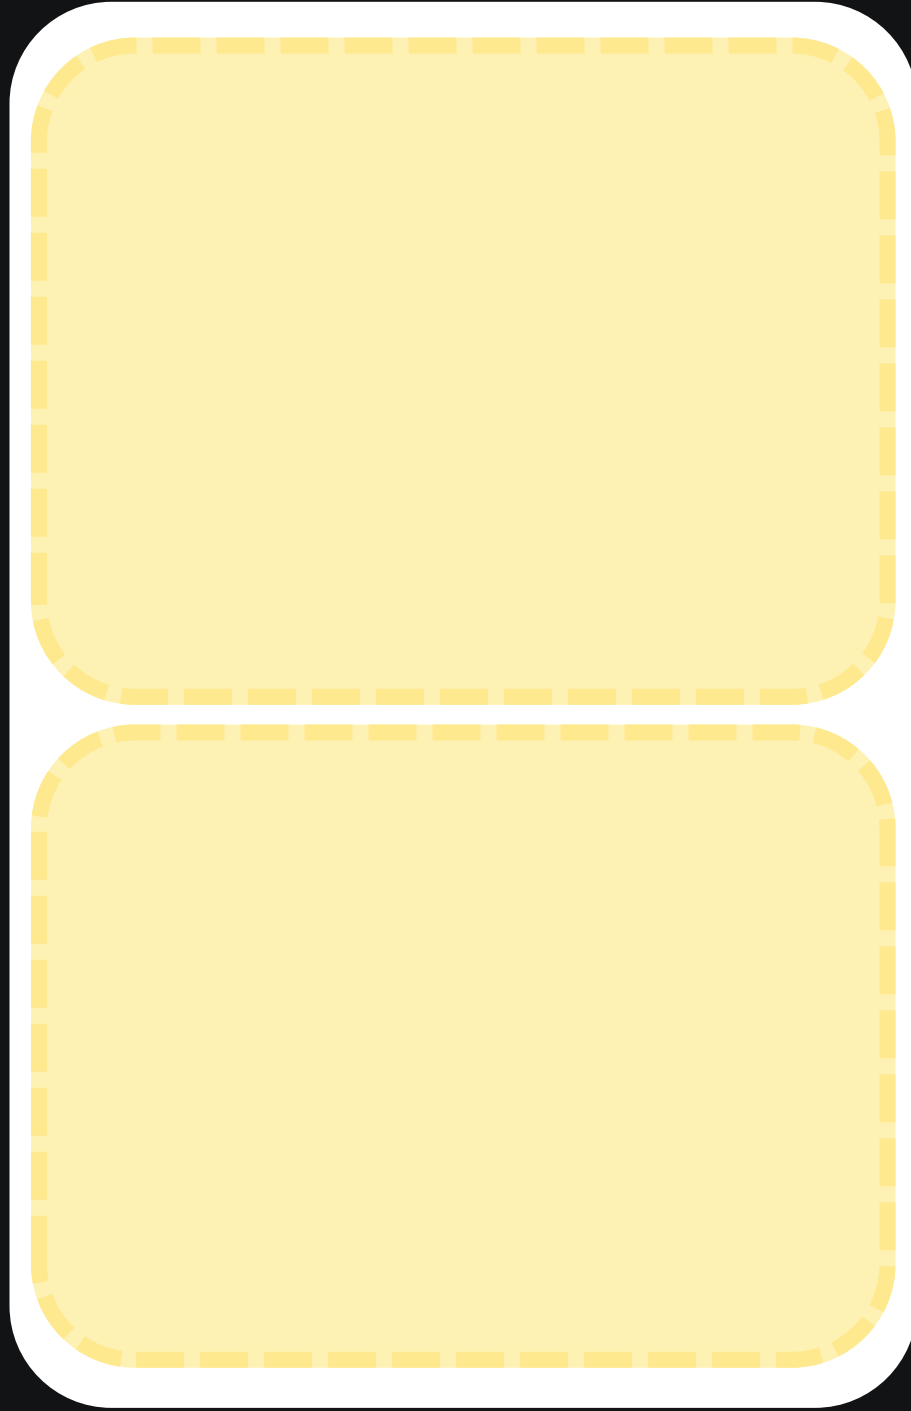

cross-axis

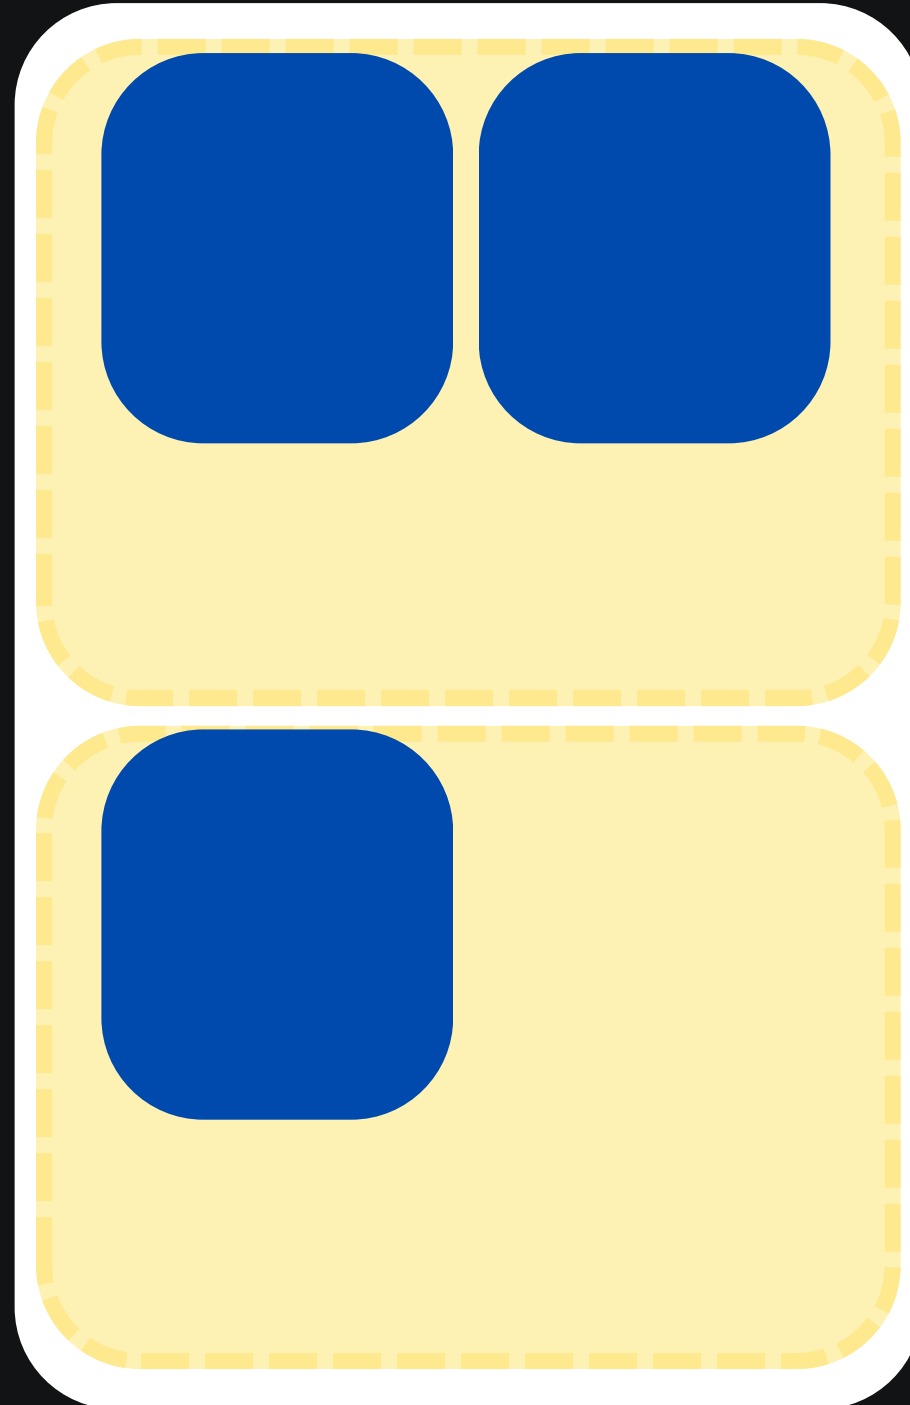

● align-content: stretch

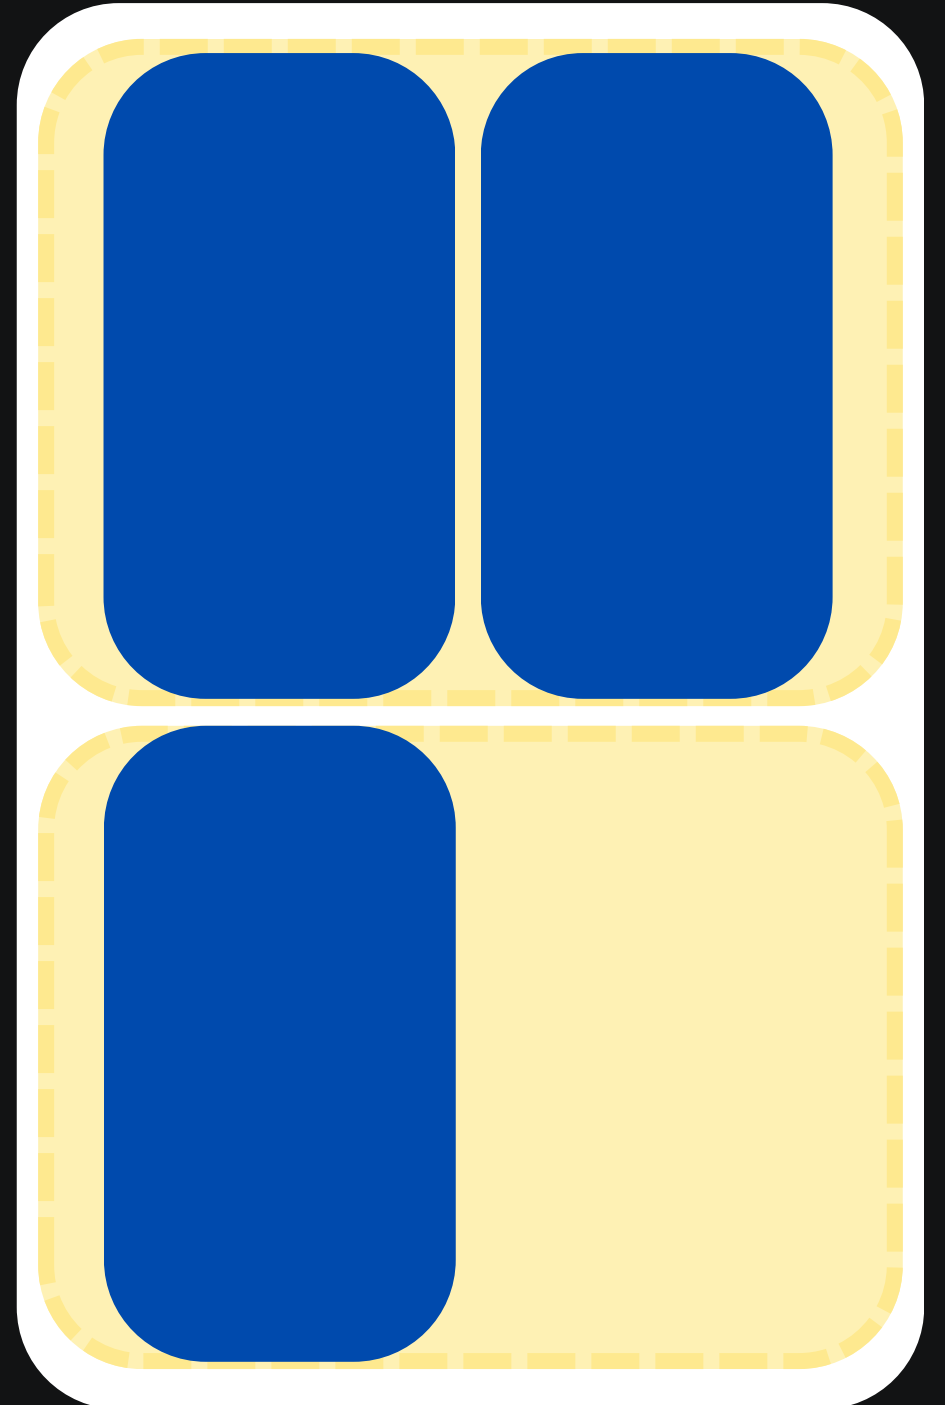

cross-axis

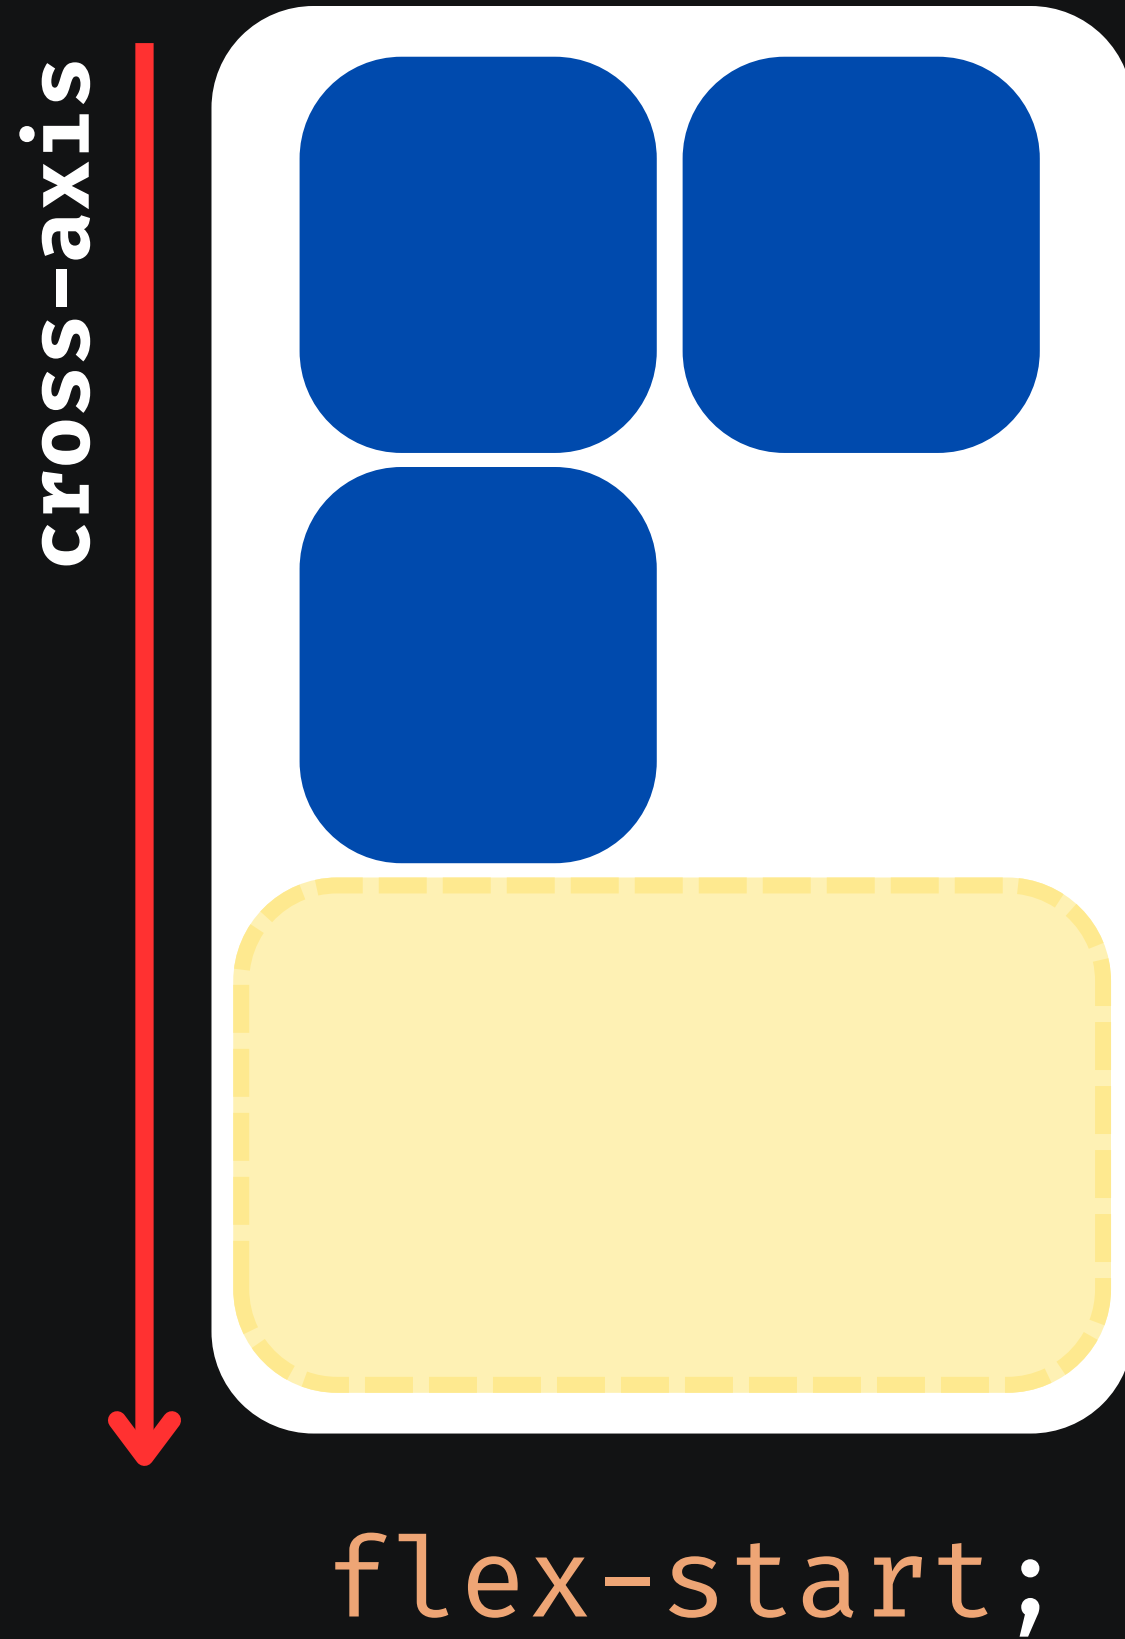

cross-axis

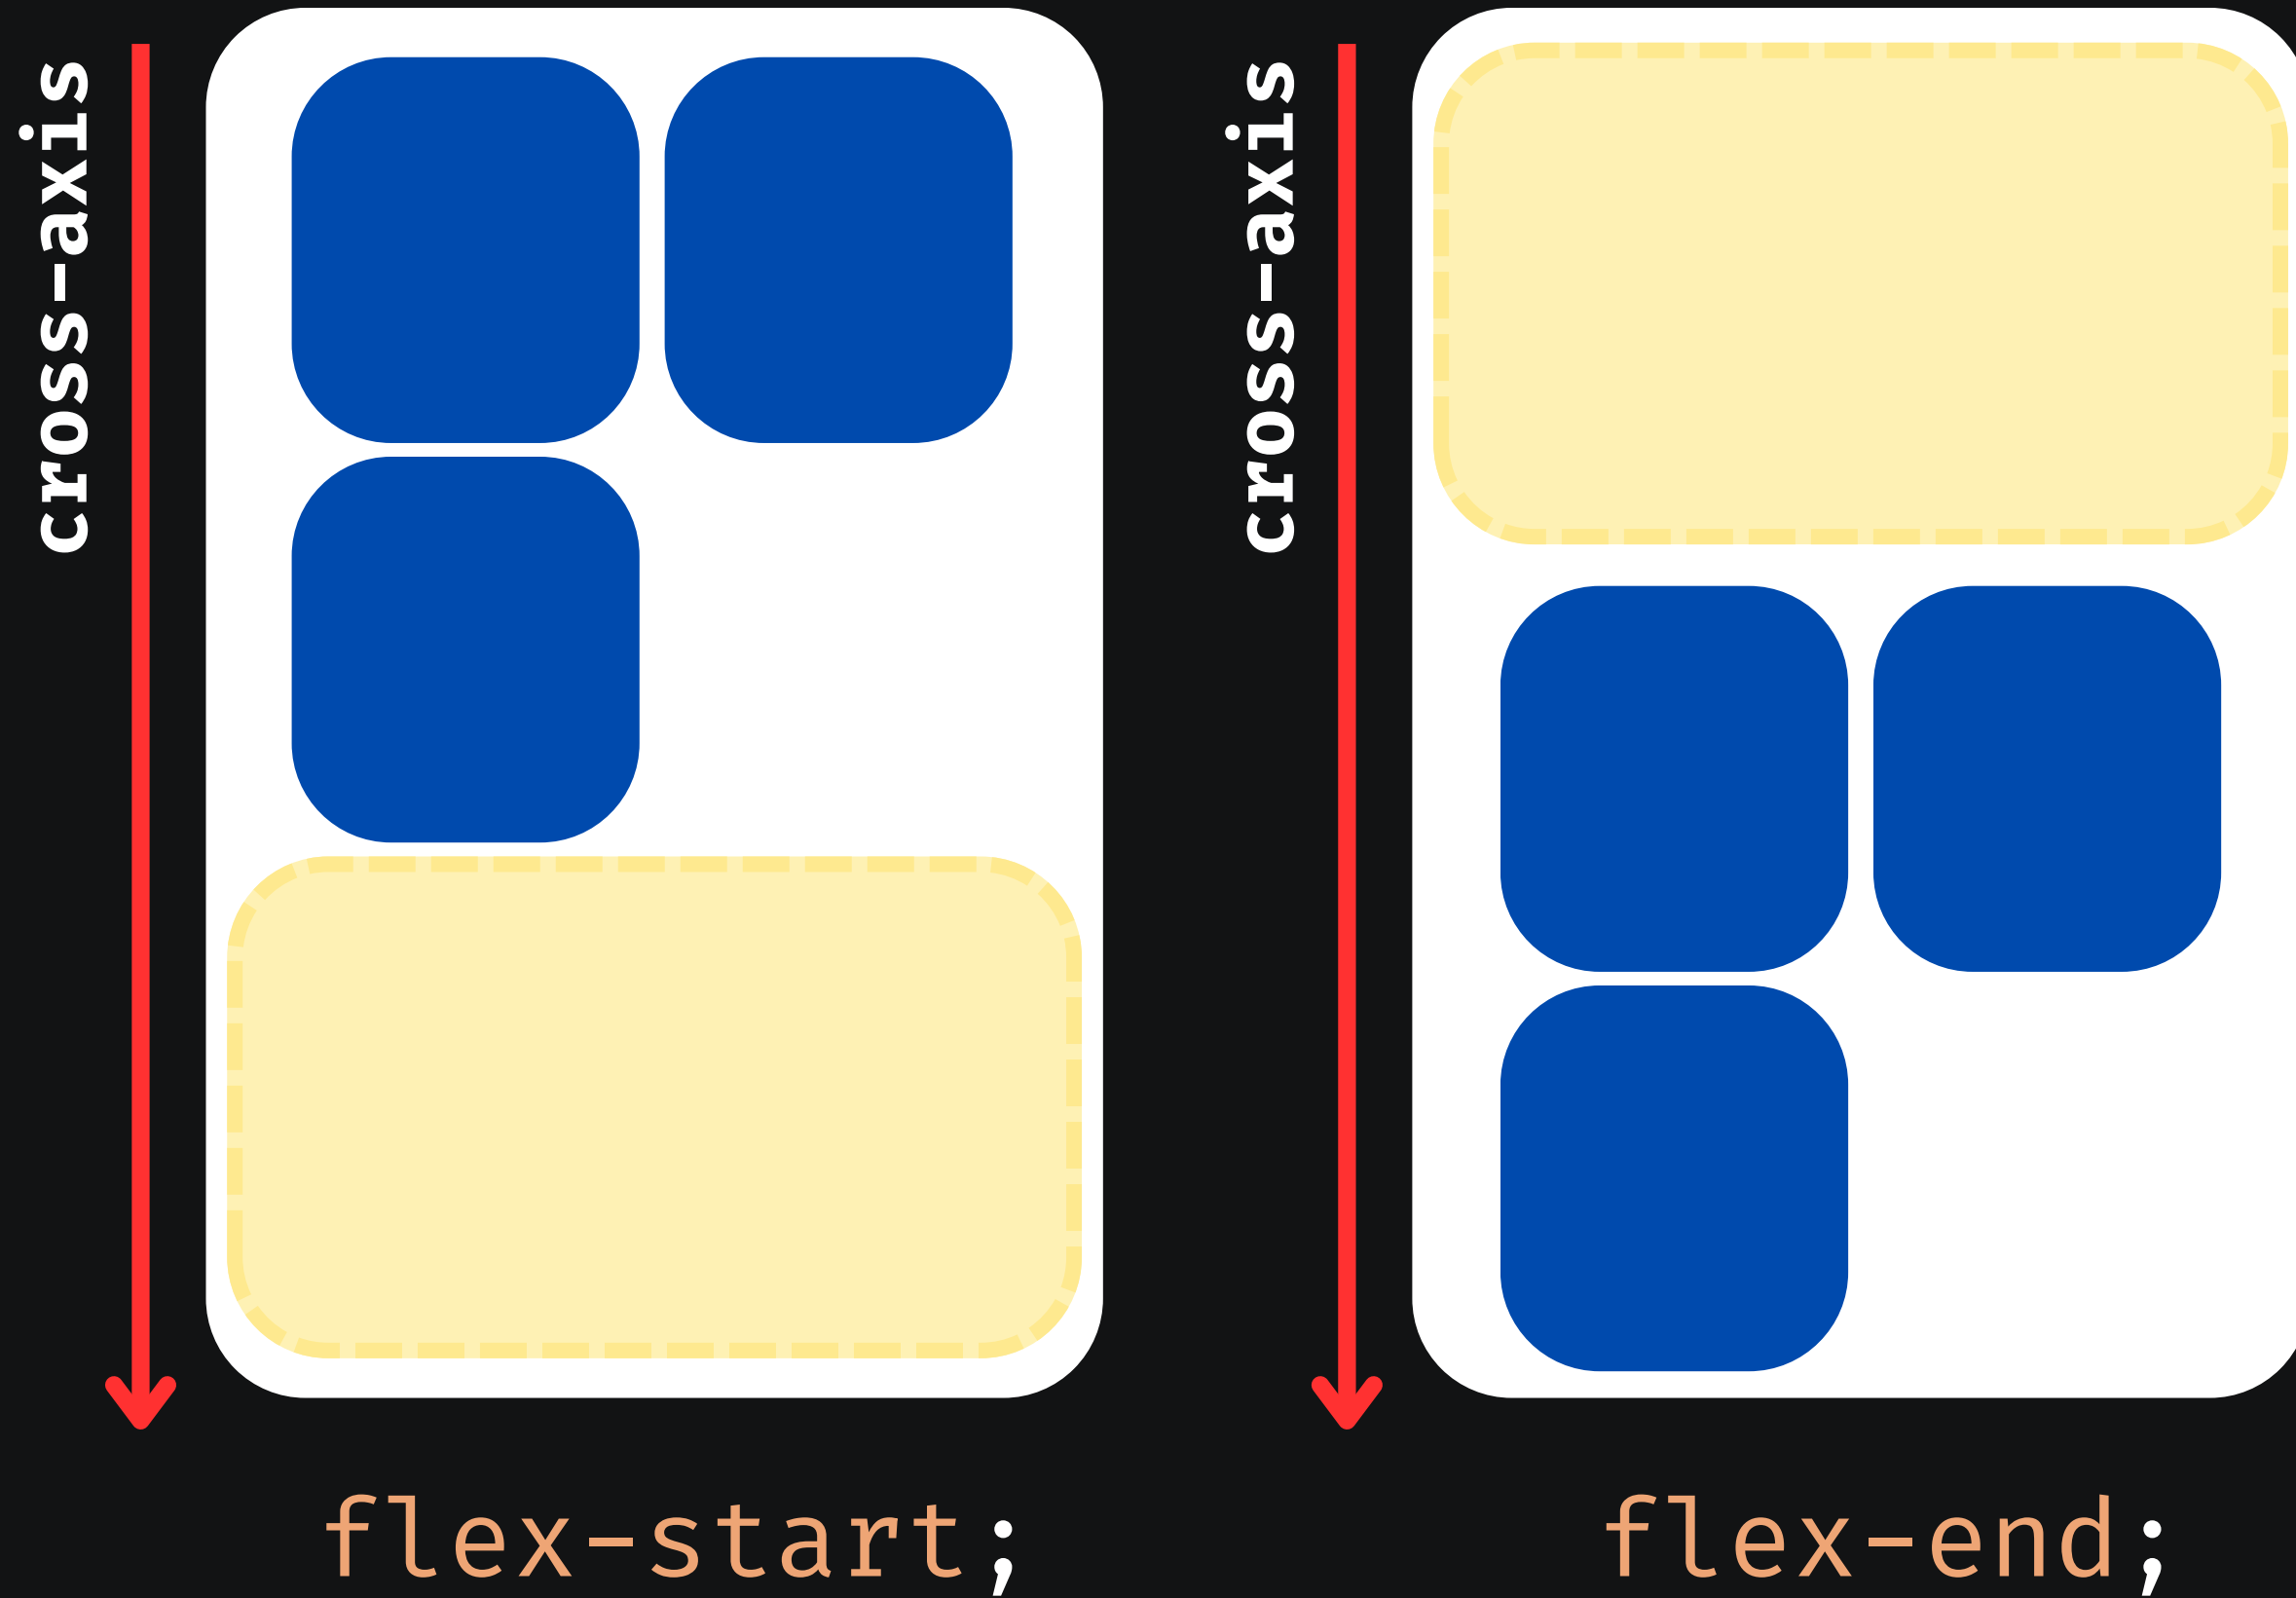

cross-axis

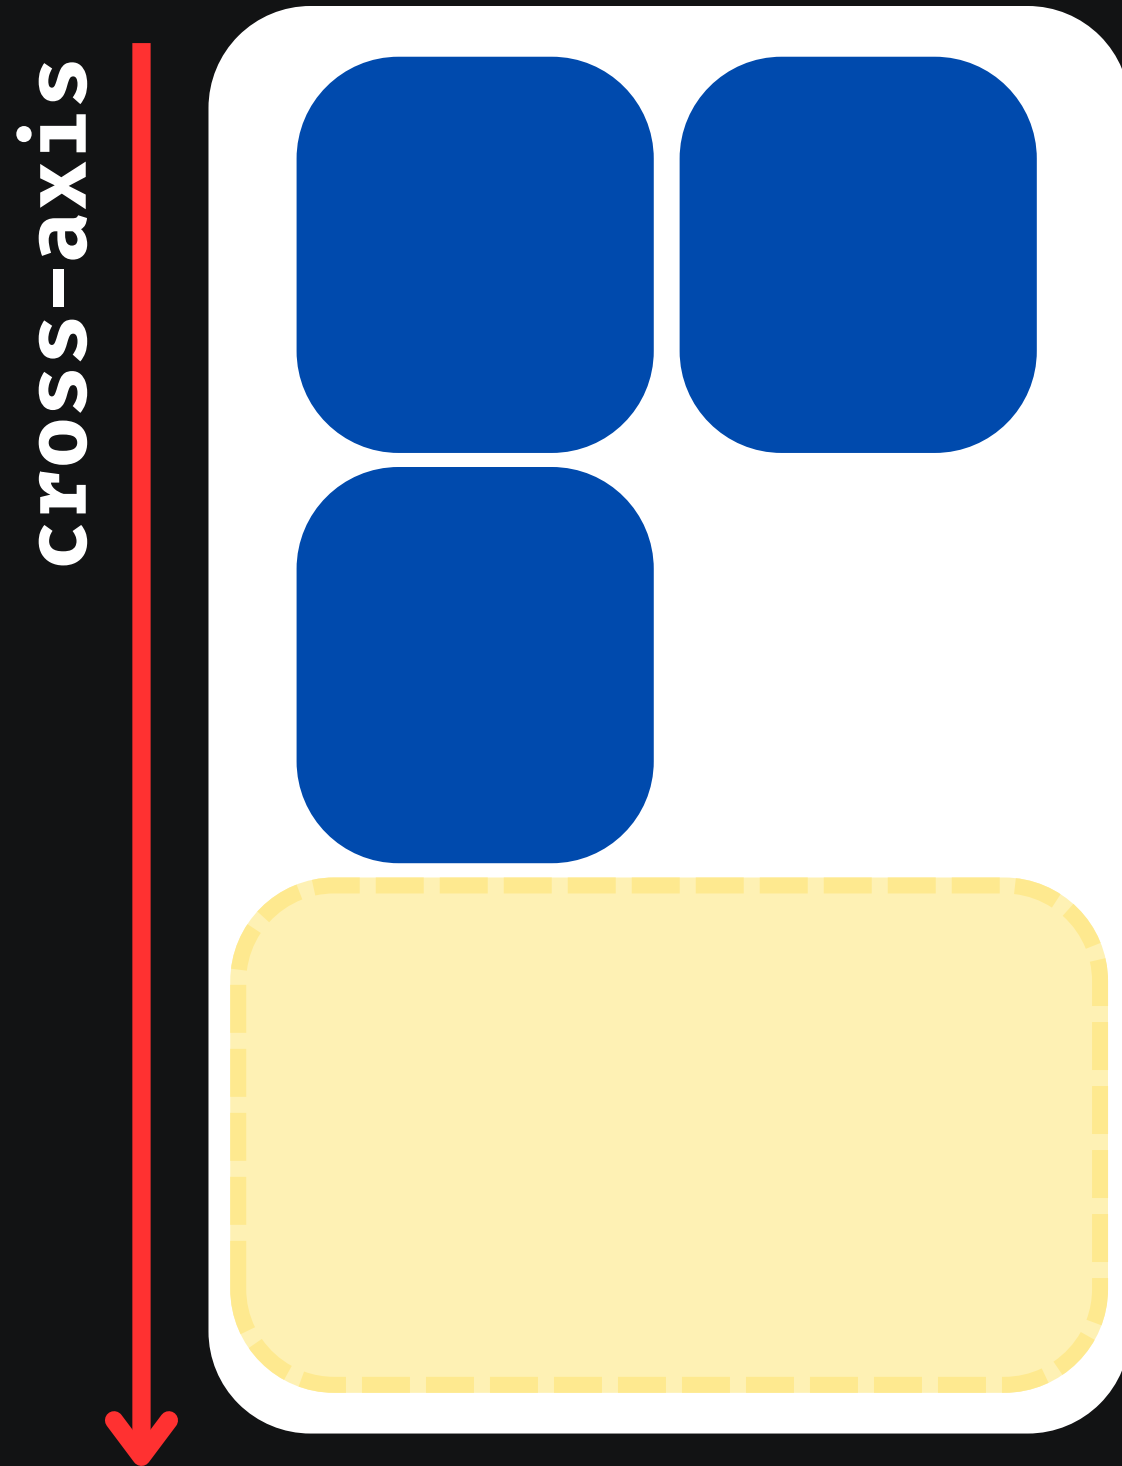

● align-content:

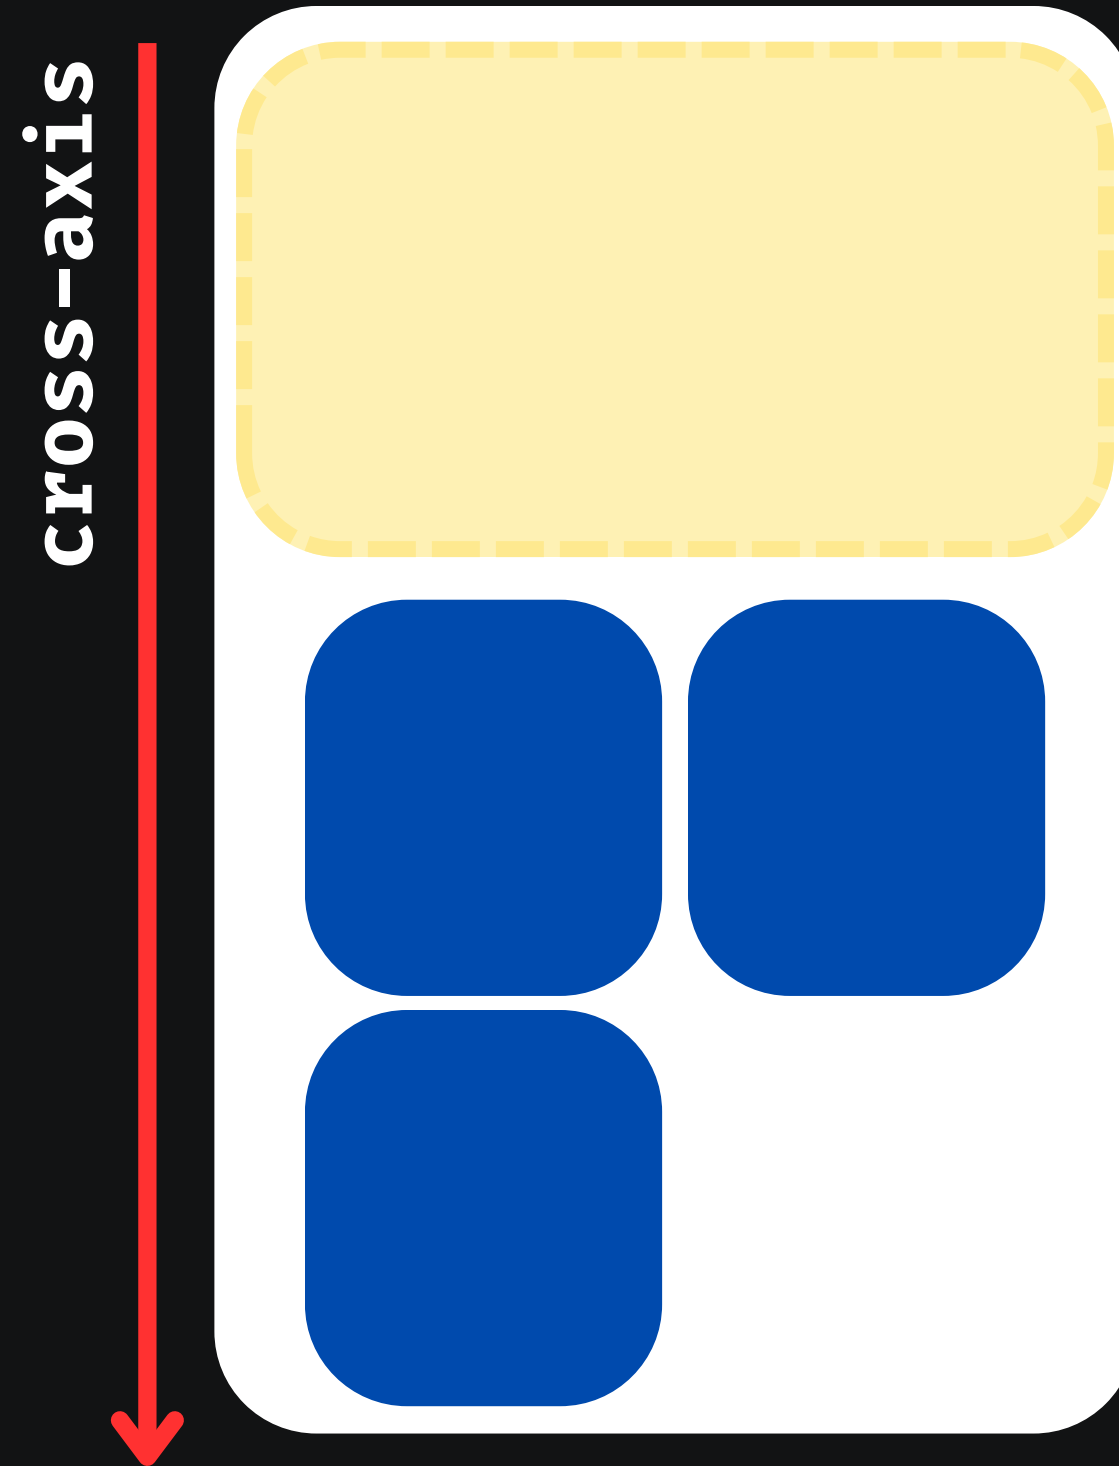

● align-content:

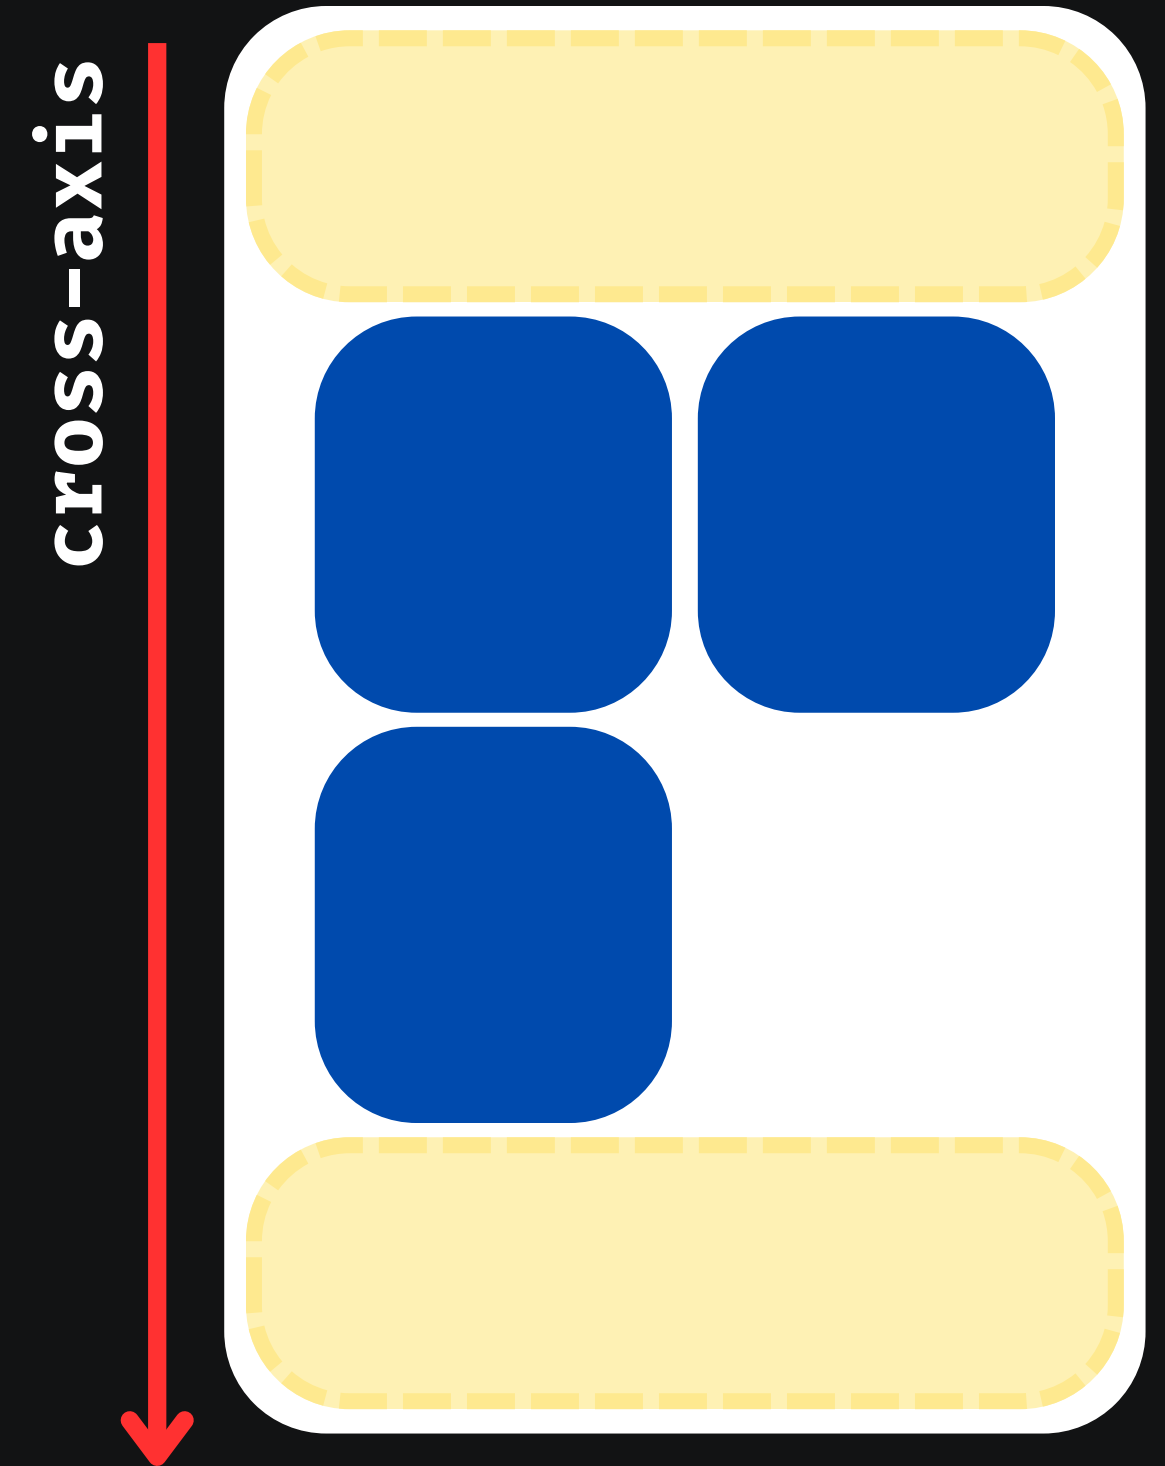

● align-content:

flex-start;

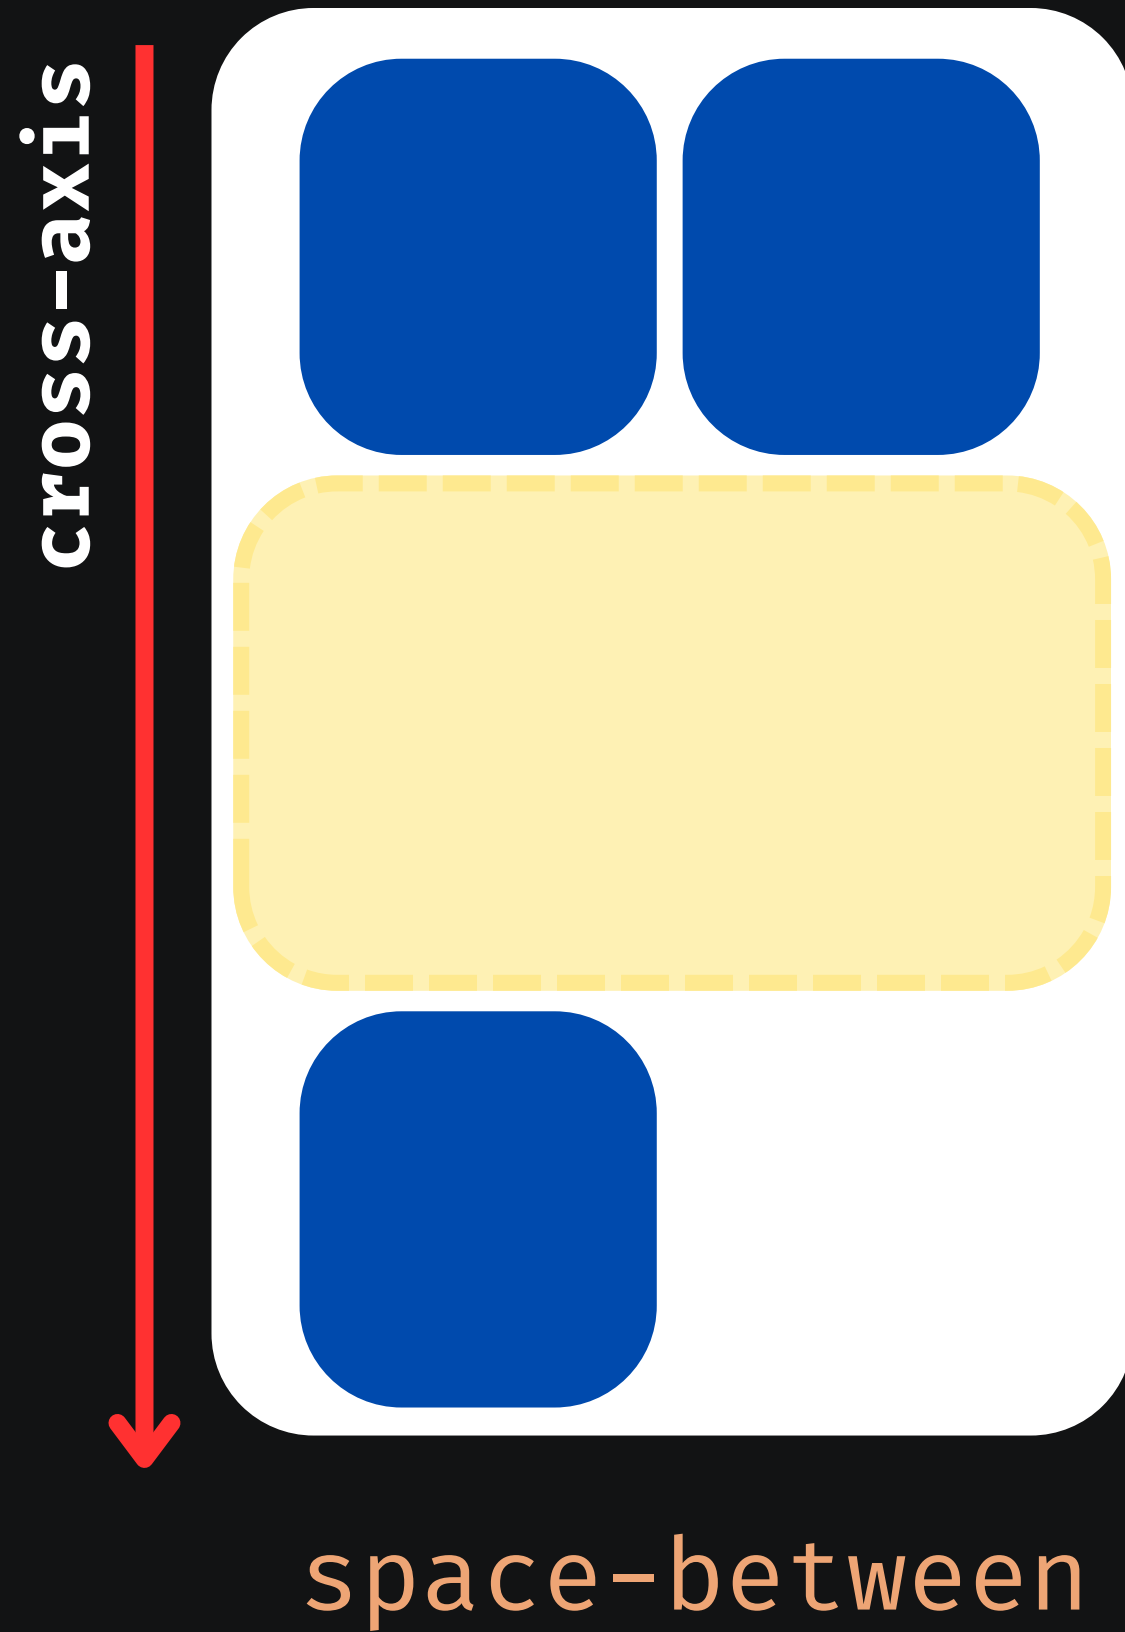

flex-end;

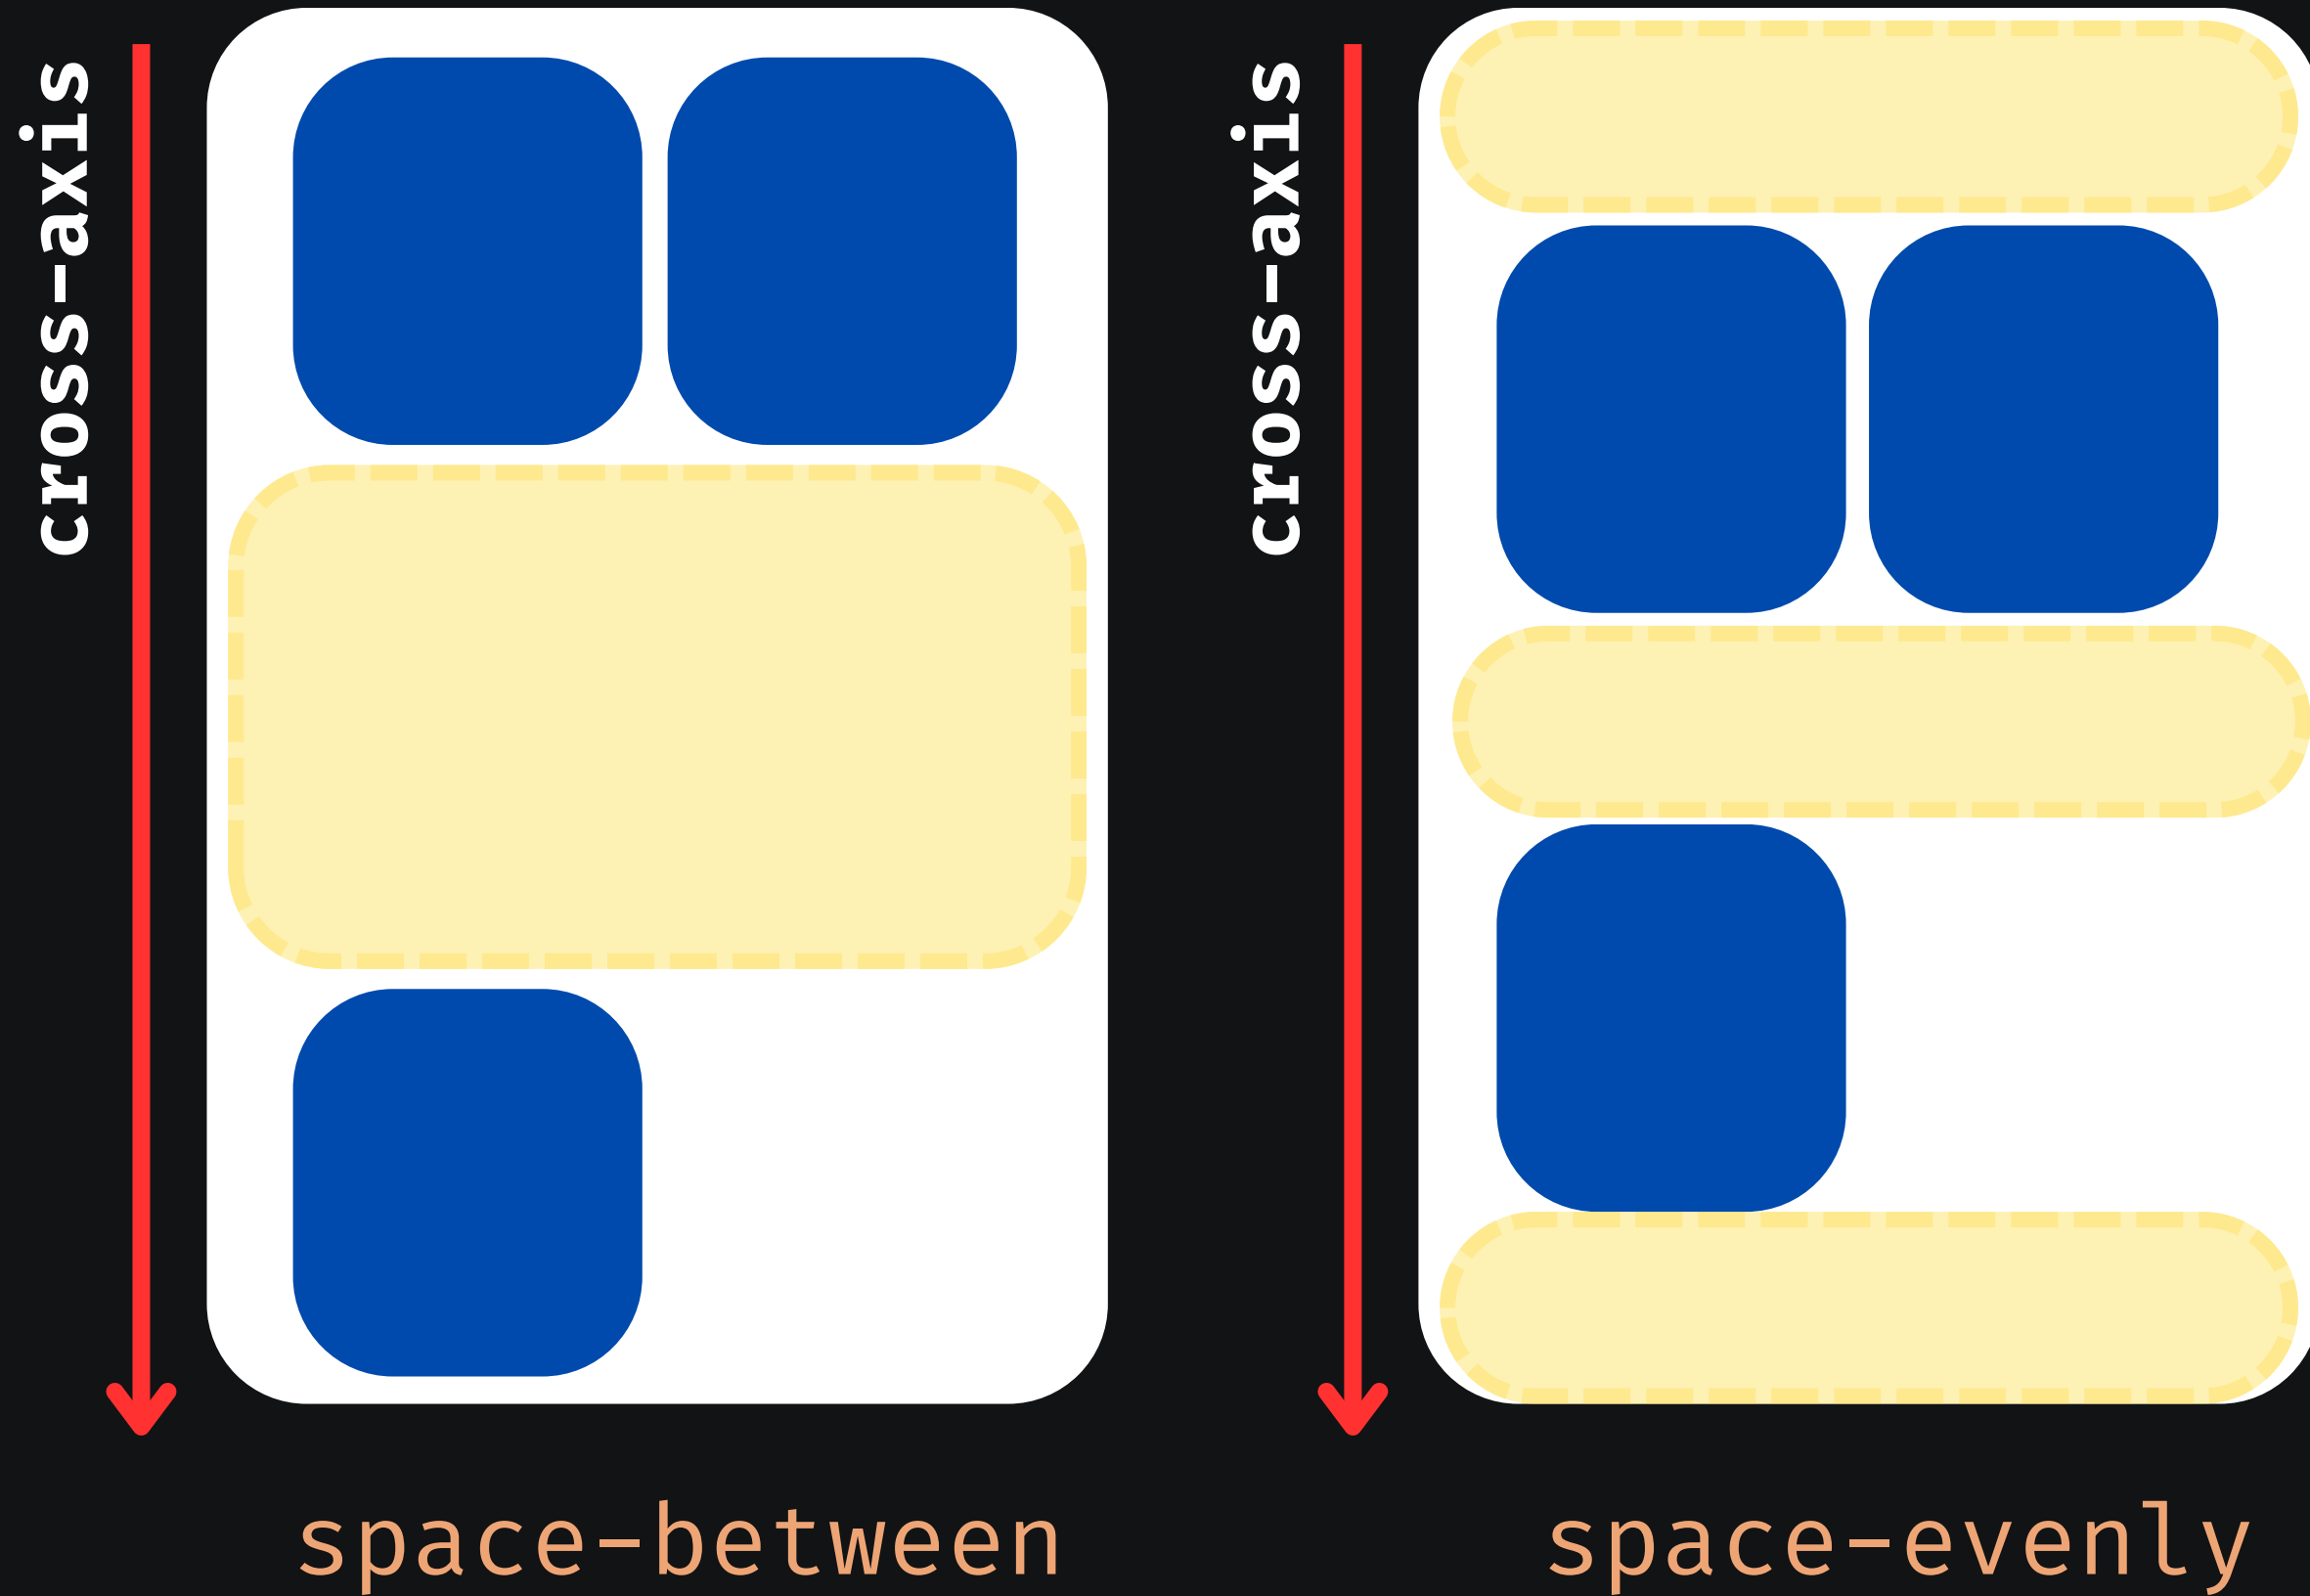

center;

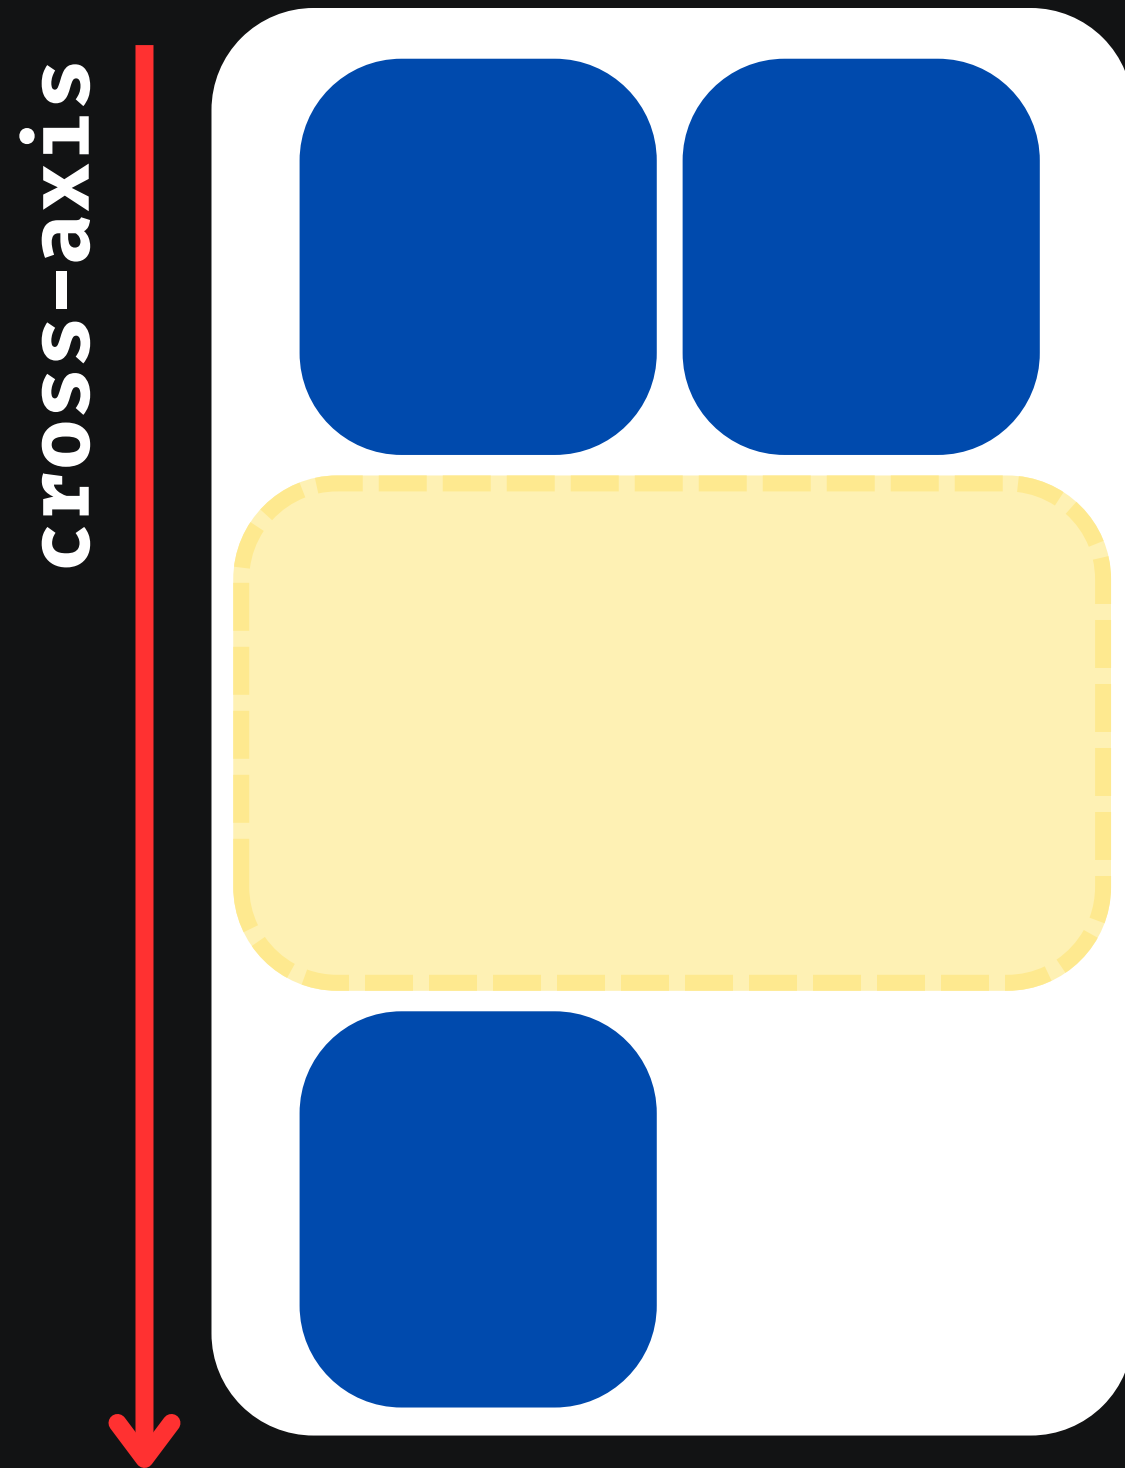

● align-content:

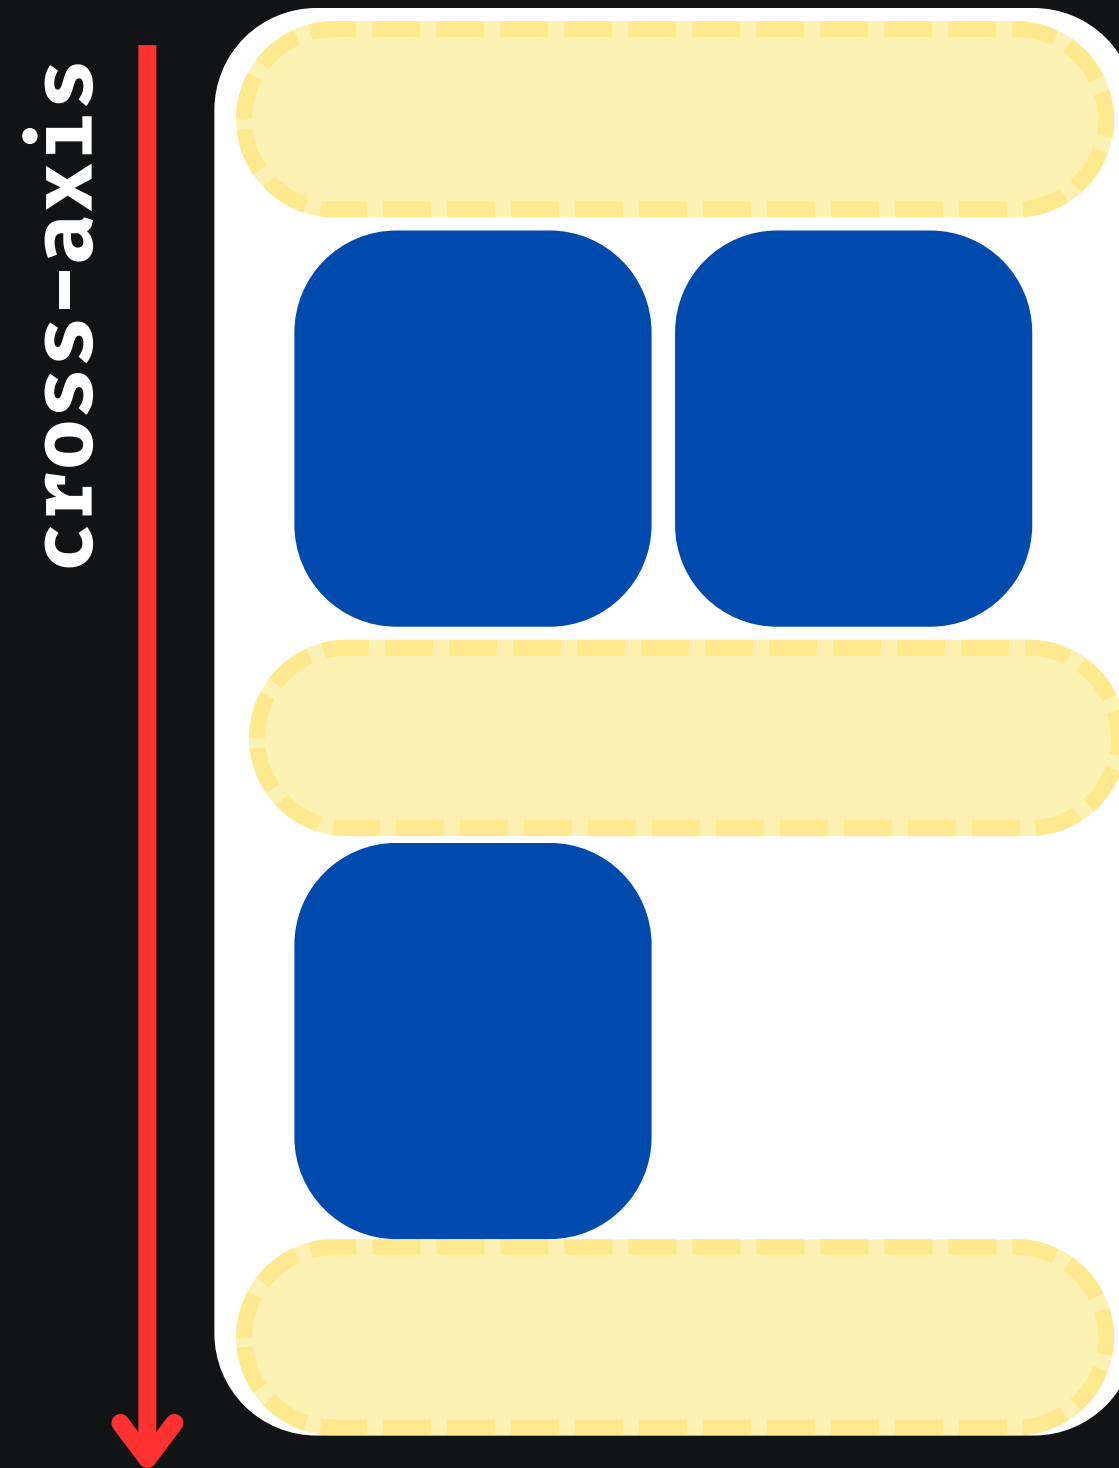

● align-content:

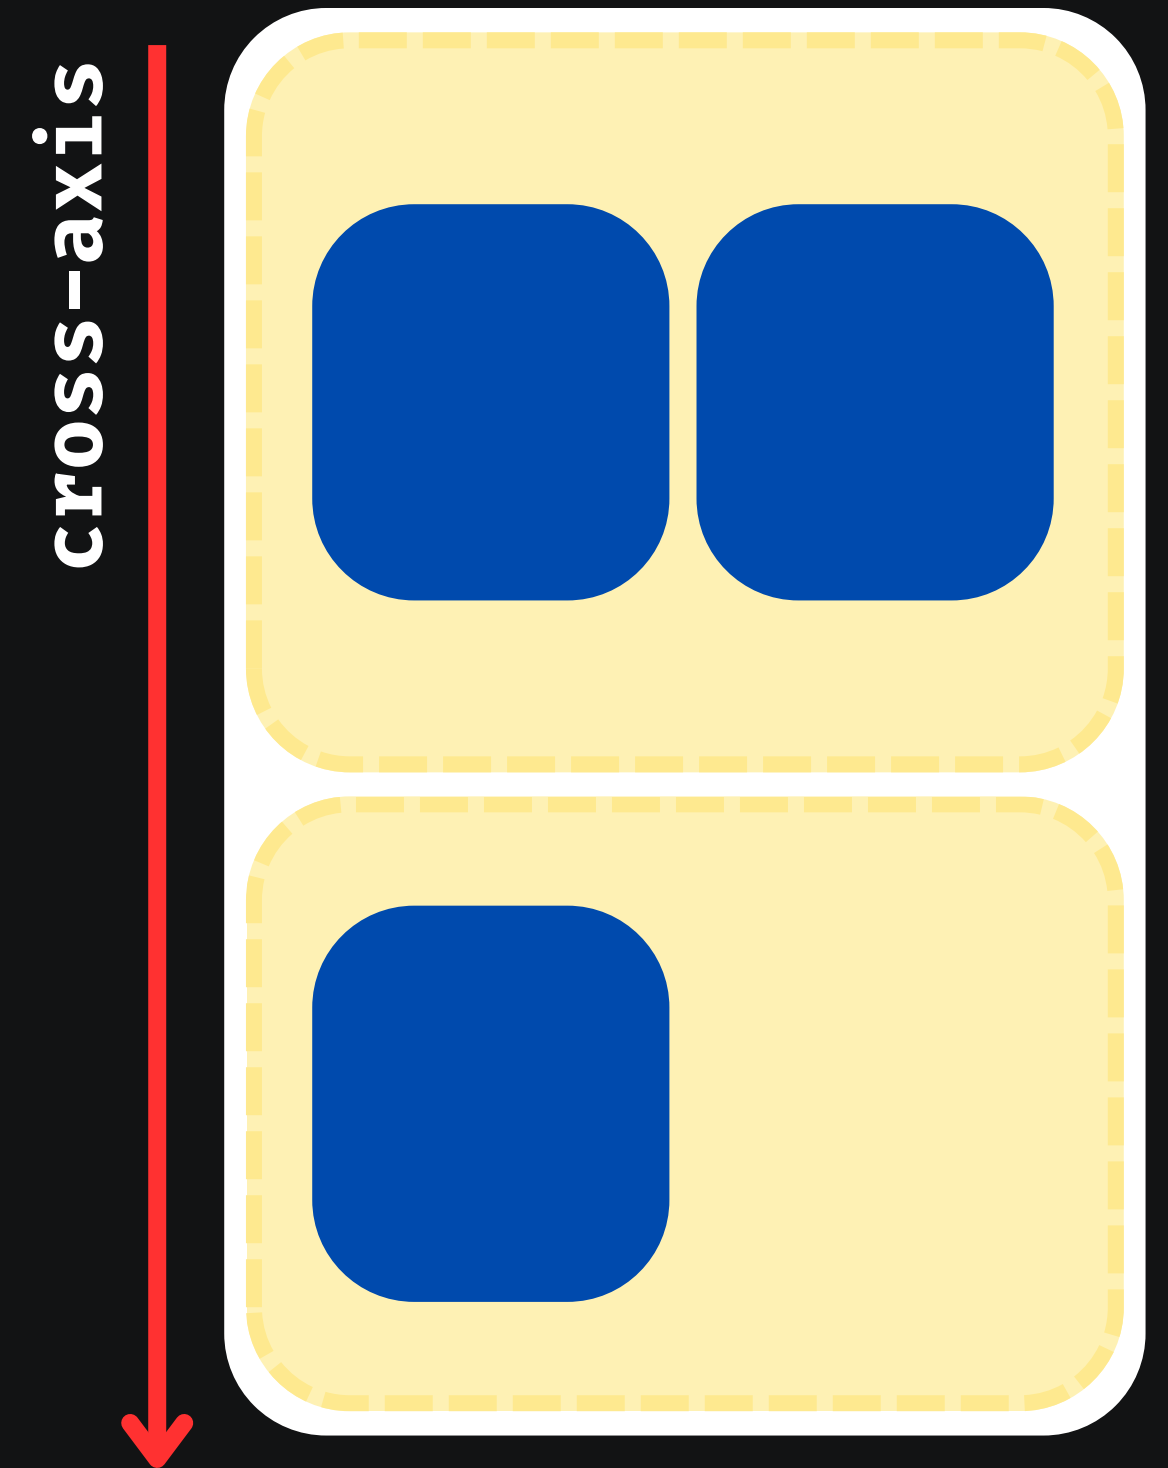

● align-content:

space-between

space-evenly

space-around
